Murder is the most reliable measure of violent crime, and the SHR provides a good indicator of its distribution, particularly at the national level. The national-level SHR homicide estimates are fairly accurate, producing similar estimates and distributions compared with other sources, such as the National Vital Statistics System (NVSS), which is a less detailed national count based on death certificates that record manner of death. The SHR tends to undercount murder and manslaughter, because of classification and coverage differences compared with the NVSS, but more accurately it counts justifiable homicides by police and citizens. The quality and accuracy of SHR data for smaller geographic units varies, but good data are available for a sizable subset of areas.

Empirical Significance

Much has been learned about homicide that may be used in crime-prevention efforts as a result of the more detailed SHR data. For example, only a small portion of homicides take place in commercial establishments (e.g., liquor stores, gasoline stations, grocery stores, and jewelry stores) or

other work settings compared with the victim's home and public places such as streets. SHR data suggest about half of all homicides occur on weekends, usually during evening hours (between 6:00 p.m. and 6:00 a.m.). Homicides most typically involve victims and offenders who are acquaintances. Important gender differences are demonstrated in the SHR data. Men are more likely to kill other men who are acquaintances or strangers. When men kill women, they are often (former) intimates. Women also are more likely to kill men; overwhelmingly, females kill family members (e.g., intimate partner and children). SHR data on the circumstance preceding homicide show that most incidents can be characterized as spontaneous ("in the heat of passion") rather than planned or instrumental. A dominant precipitating characteristic of homicide is a dispute, disagreement, or conflict.

SHR data may be aggregated and paired with indicators to assess aggregate risk factors for homicide. For example, researchers have identified similarities and differences in how features of structural disadvantage influence race- and/or sex-specific victimization and homicide rates. Attention also has been paid to whether different social conditions give rise to different sorts of homicide across relationship types. Researchers have explored trends in intimate partner homicide and have assessed reasons for why male risk has declined more than female victimization risk. The SHR data can be used to map patterns of gun homicides or other disaggregated homicide types. Extant studies, taken together, suggest that homicide victimization is not random but a function of demographic and ecological factors.

Limitations

Despite its many uses and advantages, the SHR has limitations. Homicides are more easily detected, more often reported, and frequently solved compared with other violent offenses. However, underreporting occurs when the victim's body is undiscovered or unreported or because it was not possible to distinguish between natural, accidental, or forceful causes. More pervasive and increasing, homicide is underestimated because of police agency nonreporting, which creates some challenges for researchers, perhaps including bias. Participation in the SHR is voluntary, and some

agencies do not report data at all. Others occasionally fail to submit monthly UCR Program reports or more detailed SHR reports. Nonreporting or partially reporting agencies more often tend to be smaller and more rural. Detailed SHR data are missing for about 10% of homicides known to police (UCR Program). To derive national or state estimates, SHR estimates are normed against UCR Program homicide estimates. Although an improvement, weights assume that nonreporting agencies' data are similar to reporting agencies' data, and this assumption may be invalid.

A more substantial problem is the significant and sizable increase in missing information about the offender, victim-offender relationship, and situational details about unsolved homicides. Victim data are infrequently missing, but about one quarter of offenders are "unknown." The percentage of homicides cleared by arrest has declined from about 79% in 1976 to 62% in 2005, and the proportion of SHR cases with missing offender data has increased from less than 20% to nearly 30%. Many of the unknown cases probably involved strangers and were perpetrated by young Black men in urban areas, which means that data are unlikely to be missing at random. Statisticians have developed various weighting and imputation techniques that attribute unknown characteristics based on solved cases in comparable areas that involve similar victim and incident characteristics. These approaches offer a promising solution to biases introduced by missing data.

The SHR offers detailed victim, offender, and incident data on nearly all homicides in the United States. Relatively unchanged since 1976, the SHR provides long-term data on the extent, distribution, and etiology of homicide. Problems related to underreporting and missing case characteristics can be partially addressed via developing weighting and imputation techniques. The SHR is a valuable data source that helps scholars and policy makers better understand and address differential risk of homicide victimization.

SURVIVOR PATTERNS

Human beings have a remarkable capacity for surviving extremely difficult situations. A survivor is someone who has experienced a significant traumatic event that has a disruptive effect on his or her life. The disruptive effects of the trauma tend to fall into the following four primary categories, or patterns, for survivors: reliving the event, avoidance, numbing, and feeling keyed up. Reliving the event may occur at any time. Triggers are events that cause the survivor to relive some aspect of the trauma. When the memories of the event are triggered, a feeling of fear is common, as are feelings that mimic those that occurred at the time of the trauma. Individuals may also experience nightmares or flashbacks. Triggers may be sounds, sights, tastes, or smells. Avoidance is a method by which survivors evade situations or people that trigger memories of the traumatic event. This behavior may also include avoiding even thinking or talking about the trauma. Some survivors have remarked that they experience feeling numb, and they have difficulty in expressing

feelings. Feeling numb is a method of avoiding memories and close interactions (relationships, activities, and conversations), and it may facilitate the loss of traumatic memories. Feeling “keyed up” is an alternative term for hyperarousal, which can cause the survivor to be jittery, on guard, have a hard time sleeping, have difficulty concentrating, fear for one’s safety, and exhibit a recurring startle effect when surprised.

Other common issues for trauma survivors may include drinking or drug problems, feelings of helplessness and hopelessness, tragedy, disease, disasters, and threats to the survivor’s well-being. Trauma survivors may experience employment problems, relationship issues including divorce and violence, and physical symptoms.

Survivors find ways to overcome feelings of hopelessness, tragedy, disease, disasters, and threats to their personal well-being. Those who have survived did so by learning how to use coping skills. They develop a life philosophy oriented toward self-preservation. Self-preservation is the opposite of helplessness. It involves approaching life in ways that bolster feelings of self-efficacy, mastery, and control. The research on self-preservation supports it as a major coping skill for survival.

For those who are victims of traumatic life events, they arrive at many common conclusions to achieve self-preservation. Often, people do not want to feel like victims, so taking on the label of victim may keep survivors in the role of suffering where they experience a sense of helplessness. Additionally, the victim label can lower self-esteem because individuals believe they could not preserve themselves in a time of crisis. Those who perceive themselves to be victims often have patterned responses in an attempt to protect their self-esteem, comparing themselves with less fortunate others, seeing the positive side, using victimization as a learning experience, and finding strength in being a survivor.

Self-preservation is a way of looking at life and encouraging the individual to find a balance between realism and optimism in viewing one’s self and their control over their environment and the future. Furthermore, nurturing a belief that somehow the individual can make things turn out okay (hope) promotes a sense of reality to cope with daily problems. Hope requires the ability to be flexible in finding pathways to a positive outcome in any

given situation, as well as having a positive attitude about their ability to attain the desired goal. Individuals who cope actively take responsibility to pursue their goals, while being open to finding the best coping strategies. Taking responsibility means taking charge of things that can be controlled without falling into needless stress and self-blame for events that are beyond one's control.

Currently, the most successful approaches to being a healthy survivor include immediate talk therapy and medication, or a combination of the two. Trained mental-health professionals can provide for immediate talk therapy and appropriate evaluation by a medical doctor for medications. The goal for the survivor is to reduce psychological arousal, establish some reasonable mastery in which the survivor can exert some personal control over daily life events, and restore or make new caring attachments to others. Last, the survivor needs to be able to make sense out of the trauma that he or she experienced.

Reducing psychological arousal is aided by ensuring that the survivor is safe physically, medically, and legally. Trust with others is especially important to establish but a challenge because the survivor's ability to trust has been significantly damaged. Trust is based on two characteristics: predictable behavior (doing what you say you will do, when you say you will do it) and similar values. It is recommended that survivors avoid substance abuse or addictive behavior because it serves only to complicate the survivor's capacity to respond effectively to the crisis at hand.

Restoration of a reasonable mastery means the survivor takes as much responsibility for meeting his or her own needs as quickly as possible. Through the process of education, survivors learn about the potential fallout from traumatic events, avoiding negative thinking, and managing daily life (food, rest, paying bills, and washing clothes), thereby becoming empowered. When the act of

reconnecting to other survivors is integrated into the process, health functions and the ability to connect with daily life activities are improved. Survivors need to fight the instinct to disconnect, which is often a daily struggle. Reducing physical arousal is also critical to managing the arousal experienced by survivors, and it can typically be managed through the use of physical activity, meditation, relaxation exercises, or a combination of these.

Last, making sense of the trauma requires the survivor to grieve the loss, have some understanding of the origins of the traumatic event, and develop a new sense of purpose in life. Effective grieving for a survivor includes experiencing the sadness as he or she progresses through the stages of denial, anger, bargaining, despair, and acceptance. Mourning allows the survivor to regain some control over the feelings of fear, anger, guilt, shame, and depression. As the mourning period concludes, survivors report they experience a reintegration into the present.

T

TAKE A BITE OUT OF CRIME

Take A Bite Out Of Crime is a national mass media and public information campaign in the United States put forth by the National Crime Prevention Council (NCPC). The movement started in 1978 and is aimed at raising crime prevention awareness for several common crimes (e.g., residential burglary). The campaign has four primary objectives: to change pessimistic attitudes about the criminal justice system and alleviate feelings of hopelessness about crime; to foster a sense of citizen responsibility regarding crime; to encourage collective crime prevention action through partnerships among citizens, law enforcement, and community groups; and to buttress current crime prevention efforts.

In 1980, McGruff the Crime Dog was created and has long served as the cartoonish mascot for the Take A Bite Out Of Crime message. McGruff's role has generally been educational and informational, focusing on such crime prevention themes as increasing individual responsibility, fostering community cohesion and local ties, and reducing criminal opportunities. The campaign has comprised television, radio, and print advertisements in its efforts to educate the public about crime prevention. In the early days of the initiative, much of the focus was on personal and home safety, but today many of the current campaigns address emerging crime issues such as cyber bullying, identity theft, and fraud against senior citizens. Internet crimes have become such an important crime prevention

issue in recent years that there is even a Take A Bite Out Of Cyber Crime campaign currently ongoing by the NCPC.

History

The Take A Bite Out Of Crime campaign began 30 years ago when 19 organizations came together to form a council called the National Citizens' Crime Prevention Campaign. A group called the Advertising Council put forth the initial media release in 1979, and in 1980, the first television ad aired that introduced the public to a then-unnamed cartoon dog in a trench coat, urging them to "take a bite out of crime." Shortly thereafter, these organizations and others banded together to create the Crime Prevention Coalition of America. Today the coalition consists of more than 300 organizations and thousands of members.

The coalition created and funded the National Crime Prevention Council in 1982 to administer the Take A Bite Out Of Crime campaign and advance their goals of fostering cooperation between citizens and law enforcement, and to promote crime prevention awareness through advertisements and training. Over the long history of the NCPC and the Take A Bite Out Of Crime campaign, there have been several noteworthy accomplishments on the part of the organization. For instance, more than \$1.4 billion in advertising time and print space has been donated for the public service announcements since 1980, and in 2003, *Worth* magazine named the campaign one of the nation's 100 best charities.

The NCPC offers numerous training and crime prevention programs as a public service. This training currently includes such topics as crime prevention through environmental design, campus crime prevention, teen victims of crime, bullying and intimidation, and many more. In addition, the NCPC offers many crime prevention programs geared toward the needs of specific age groups, ethnicities, and neighborhoods. Current programs include Teens, Crime, and the Community; Outreach to New Americans; Project Safe Neighborhoods; and McGruff House, among others.

McGruff the Crime Dog

McGruff is the mascot for the Take A Bite Out Of Crime campaign, and in 2005, he celebrated his 25th birthday. At that time, estimates by the Advertising Council indicated that 93% of children in the United States were aware of McGruff and his efforts to provide crime prevention tips; 96% of adults were aware of the “Take a bite out of crime” slogan. So in terms of brand recognition, McGruff has been a tremendous success.

The McGruff character was created by Sherry Nemmers. John M. Keil, an artist, is credited with writing the slogan and acting as the voice of McGruff in television and radio announcements over the years. McGruff received his name 2 years after his debut through a nationwide contest to find a name for the character. Other popular suggestions included names such as Sherlock Bones and J. Edgar Dog. Besides television and radio advertisements, McGruff has also lent his likeness to crime prevention pamphlets and books, billboards, costumes (for public appearances), a 32-foot traveling inflatable (for fairs and large events), products (such as plush animals), and even a monster truck in Arizona and a “wiener wagon” in Florida. McGruff’s name and image are also associated with many of the programs funded by the National Crime Prevention Council, such as McGruff House, McGruff Truck, and McGruff Neighborhood.

McGruff Programs

These McGruff programs represent a partnership among local coordinators and volunteers, law enforcement, and school personnel. The McGruff

House program offers kids a safe place to go when they are in danger or when they feel threatened or fearful when they are playing in the neighborhood or walking to or from school. These locations are safe havens that might be houses, townhomes, apartments, or trailers, and they are specially marked with identifiable signage, so kids can easily recognize them. The partnership with local schools is important in educating children about the program and its purpose. The volunteers at McGruff houses reassure the children and contact the authorities if necessary. The McGruff House program began in 1982 with the first house in Utah, and now 48 states have McGruff houses, with Nebraska having over 1,000.

The McGruff Truck program operates under a similar philosophy as the McGruff House program. In this case, the trucks are often utility trucks marked with the McGruff logo. People who feel there is a danger nearby can signal these trucks to pull over, and the drivers will radio the authorities for help. Currently 125 utility companies are participating in the McGruff Truck program, with 25,000 utility trucks bearing the McGruff Truck logo.

The purpose of the McGruff Neighborhood initiative is to provide and coordinate the McGruff House, McGruff Truck, and other programs focused on keeping children safe at school and in their neighborhoods. The foundation for the McGruff Neighborhood program is McGruff Club and local elementary schools. McGruff Club, in partnership with these schools, teaches children between the ages of six and ten about crime prevention and other safety issues.

Take A Bite Out Of Cyber Crime

The Take A Bite Out Of Cyber Crime campaign is an extension of the earlier Take A Bite Out Of Crime efforts to increase safety and crime prevention awareness but applied to an online environment. The campaign is a collaborative effort among the National Crime Prevention Council, the Forum to Advance the Mobile Experience, and the Chief Marketing Office Council. The primary focus of the campaign is the fight against cyber-crimes such as spam, computer viruses, phishing, identity theft, cyber bullying, and online predators. There is also a focus on educating the public, and

especially children, about general Internet safety. This safety education teaches kids about the dangers that the Internet might pose and makes them aware of how they can avoid them.

Empirical Evaluations

There have been two large-scale evaluations of the Take A Bite Out Of Crime media campaign. The first evaluation of the program occurred in a 3-year period (1979–1981) after the initial introduction of the publicity campaign. The second evaluation was undertaken in 1992, 12 years after the first Take A Bite Out Of Crime television advertisement aired.

First Evaluation: O'Keefe and Mendelsohn

In the first evaluation of the Take A Bite Out Of Crime campaign, researchers used survey methodologies to determine the general response to the campaign and to assess the state of respondents' crime prevention efforts after being exposed to the public service announcements. To assess the overall exposure of the campaign, the researchers conducted a survey of a national probability sample of 1,200 adults. Of this group, 63% of respondents said they were "very sure" they had seen the Take A Bite Out Of Crime public service announcements, and 29% indicated they were "fairly sure" they had. In terms of which medium proved the most successful in reaching the target audience, it was determined that television was the most prolific. Overall, 78% of respondents identified television as the source of exposure to the announcements, followed by billboards at 14%, newspapers at 8%, radio at 6%, and magazines at 5%. Additionally, 88% of those who had seen the advertisements were able to recall some specific crime prevention message beyond simply the logo or the McGruff character. The researchers were also able to determine that the media campaign had reached a demographically diverse audience.

A three-city survey of 426 adults was used to examine the second goal of the study, which was to determine the campaign's impact on attitudes and crime prevention awareness and efforts. Of these respondents, 22% reported having learned something from the advertisements, and 46% said they had been reminded of something they had forgotten. More

than half of the group reported feeling more responsible for crime prevention and concerned about crime; however, 22% indicated that they were more fearful having seen the advertisements. In addition, almost one fourth of those who had been exposed to the campaign messages reported taking crime prevention measures as a result. However, only 2% of respondents who had been exposed to the advertisements requested or sought out more information about crime prevention. Respondents were also asked about perceptions of crime in their neighborhoods, and it was determined that the campaign had no effect on these attitudes.

In sum, this early study investigating the effectiveness and response to the Take A Bite Out Of Crime initiative indicated that the public's awareness of the campaign, the McGruff character, and the crime prevention messages of the ads had generally been successful and well received. In addition, a sizable portion of study respondents indicated having taken some additional crime prevention efforts as a result of exposure to the public service announcements.

Second Evaluation: O'Keefe, Rosenbaum, Lavrakas, Reid, and Botta

The second evaluation of the Take A Bite Out Of Crime campaign was undertaken in 1992 and published in 1996. The research strategy included national-level sample surveys of U.S. citizens, crime prevention practitioners, media managers, and law enforcement. The national multistage cluster sample resulted in a sample size of 1,500 adult citizens in addition to the other study participants (e.g., law enforcement officials). The surveys were administered by telephone. In addition to the surveys, the researchers conducted extensive content analyses of campaign materials to identify common campaign themes and messages.

The campaign evaluation researchers had four primary goals in assessing the Take A Bite Out Of Crime media campaign. The first goal was to determine whether the campaign was an effective method for preventing crime among its target audience. Second, the evaluators were concerned about the success of the media elements of the campaign (in terms of audience exposure, interest, and reaction). Third, the researchers were interested in identifying ways to improve the program or design

successful programs in the future. The final goal was to assess the cost-effectiveness of the campaign for crime prevention.

In terms of campaign exposure, the researchers concluded that 85% of surveyed adults indicated they had seen the McGruff public service announcements. Most respondents indicated that they had seen the ads on television, and 86% reported that they had paid "high attention" to select advertisements. Most respondents familiar with the announcements were able to name something specific they liked about them. The groups most familiar with the announcements were younger adults with children at home, those attentive to the media, interested in crime prevention, in need of crime prevention information, aware of neighborhood problems, and likely to take preventive action. Black adults were slightly more aware of the advertisements than White adults, and middle-income respondents were slightly more familiar than other income groups.

Regarding campaign effectiveness, it was reported that nearly one in three respondents indicated that they had learned something from the advertisements. One in five participants indicated that they had taken specific action based on the campaign messages, and 54% became more concerned about crime. Respondents indicated that the public service announcements were effective in increasing a feeling of personal responsibility for crime prevention (47%), their crime prevention awareness (70%), their awareness of drug abuse prevention (90%), children's awareness of crime prevention (90%), and children's awareness of drug prevention (88%); 36% of respondents indicated that they were more confident in protecting themselves. Greater effectiveness was reported among women, the less educated, lower income, Blacks, and parents with children at home.

In sum, most study participants (including the public, media, and law enforcement) indicated that they had recognized McGruff and the Take A Bite Out Of Crime campaign messages as important symbols of crime prevention and awareness education. The trend seems to be that the campaign gained in both popularity and overall impact over the years in between evaluations. The findings also indicate that, more generally, media campaigns can be fruitful tools for influencing crime prevention behaviors of the public.

Publicity and Media Campaigns as a Crime Control Tactic

In general, publicity and media campaigns have essentially two utilitarian values in terms of crime prevention—to increase the visibility or presence of certain crime prevention initiatives (such as the implementation of a new Neighborhood Watch program or a crackdown on drug dealing in a particular part of the city) or to raise the public's awareness of crime (e.g., through education). The distinction between these goals or outcomes is which group is the target of the publicity—offenders, victims, or the general public. In the case of the Take A Bite Out Of Crime campaign, the target is the general public and those most at risk of victimization, and the message is conveyed through formal channels such as radio and television. This is in contrast to a more informal publicity campaign that, for example, may rely on word of mouth between offenders (perhaps that the police are watching an area).

The empirical evidence surrounding the success of publicity as a crime control tactic is in the early stages of development, and the research that has been conducted has not been entirely conclusive, but a few general points can be made regarding the issue. First, it seems that media campaigns can have a positive effect on crime prevention. Specifically, such publicity can shape perceptions of fear, educate the public about crime prevention precautions, and encourage the adoption of crime prevention measures. Second, some evidence suggests that publicity efforts that target offenders often result in anticipatory benefits or crime prevention benefits that occur prior to the implementation of a crime prevention initiative or program. For instance, word that closed-circuit television has been installed in an area may result in fewer area crimes, even before the cameras have been put in place. Finally, such media and publicity tactics do not seem to have much success at reaching those most vulnerable to crime but those who are less vulnerable to victimization or who are already interested in crime prevention.

Conclusion

The Take A Bite Out Of Crime public service campaign began more than 30 years ago and,

along with the NCPC, has since become an important partner with law enforcement and schools in educating the public about crime prevention. Many of the campaign's programs and initiatives are specially designed to cater to specific audiences, such as children in elementary schools or other high-risk groups (e.g., elderly persons who are often the targets of identity theft schemes). The most identifiable element of the public service advertisements is McGruff the Crime Dog, whose signature slogan, "Take a bite out of crime," provided the name for the crime prevention campaign. There have been two important evaluations of the campaign, which generally concluded that the messages have successfully reached those who are either most interested in crime prevention or are the least at risk of victimization.

TEEN DATING VIOLENCE PREVENTION

Teen dating violence (TDV) is more common than many people might assume because intimate partner violence is usually understood as involving adults; therefore, rarely are young people considered. It is difficult to get a clear picture of the issue because different studies and surveys ask different questions and, thus, often get different answers. This entry examines the definitions of TDV, including physical, psychological, and emotional abuse and sexual violence. Statistical findings are assessed, and the causes and responses to this form of violence are considered.

Definitions

Research on violence within teen relationships is limited, but increasingly a definition emerges of a continuum of controlling and abusive behavior within a romantic relationship, ranging from physical and sexual violence to verbal and emotional abuse and including financial control and peer group "disrespect." Conventional definitions of intimate partner violence are insufficient in understanding the different harms, impacts, and consequences of dating violence. TDV can happen to girls and boys from all types of homes and from families of all cultures, income levels, and educational backgrounds. Dating violence may be a single event or repeated episodes of violence and can have impacts later in the life course and in reproductive health. TDV may be similar to the cycle of violence witnessed in battered woman syndrome, where the severity of the abuse escalates over time and where control, denial, and blame are features of the relationship, making intervention problematic.

Extent

Estimates suggest that 15% to 42% of all high-school students in America have had at least one violent experience within the context of a date. Forty percent of girls ages 14 to 17 years report knowing someone their age who has been hit or beaten by a boyfriend. Females ages 16 to 24 years are three times more vulnerable to intimate partner violence than any other age group. Estimates of sexual violence vary from 3% to 23% for female high-school students and 2% to 4% for male students. Vulnerabilities are noticeable in 14- to 16-year-old girls receiving child protection services, more than half of whom in a survey in the late 1990s reported sexual and physical violence at the hands of a dating partner. Adolescents who experience both sexual and physical TDV remain at higher risk from violence when they become adults than those who experience no dating violence. Additionally, men who engaged in adolescent sexual violence are more likely to sexually assault than those without a history of sexual assault.

The existence, persistence, and seriousness of violent behavior in adolescence are together an indicator of violence in later life, and the association between adult domestic violence and TDV must not be underestimated. The roots of adolescent violence may lie in early childhood through learning how to relate to others by witnessing violence within the family. Although not all TDV is a consequence of witnessing domestic violence, it may be that “learning to use violence” and “putting up with violence” are socialized gender norms within society.

Response and Prevention

Programs that seek to prevent and respond to TDV are necessary because of the serious and pervasive consequences of TDV. More than 80% of parents either believe TDV is not an issue (or do not know whether it is an issue), and most parents do not speak with their children about TDV. It is important that schools respond to complaints of TDV. Most existing programs can be divided into two interrelated categories: those that act immediately to provide services and those aimed at increasing awareness and producing attitudinal change.

Frontline workers in health care, social services, criminal justice, and education need to know how to recognize the signs of TDV to help decrease the level of violence and mobilize efficiently the resources necessary to ensure that services are appropriate for young people. An understanding of early risk factors (such as anti-social behavior, involvement with drugs, early sexual involvement, and exposure to violence) and warning signs (such as teens apologizing for the boyfriend or girlfriend's behavior, unexplained bruises, avoiding eye contact, and unexplained crying) equip service providers. Many adolescents may be reluctant to approach services such as domestic violence shelters, sexual assault nurse examiners (SANEs), sexual assault response teams (SARTs), and rape crisis centers that may seem to be aimed at adults. What is certain is that more research is needed to determine how SANE-SART programs can be made more appropriate for adolescents if criminal justice reporting and prosecution is to be successful for TDV.

The development of community and school-based TDV prevention programs can complement criminal justice and health services. Raising awareness on issues such as domestic violence and rape is vital if the problems of interpersonal violence are to be solved. Frontline workers, therefore, also have a role in future-facing prevention programs. Community and school-based programs typically tend to last from 1 session to more than 20 sessions. Talking with young people about appropriate behavior in relationships, how to express difficult emotions, and how to resolve conflicts nonviolently are features of many programs. Programs such as the “Fourth R” and “Safe Dates” use theater and school activities to provide young people with information on how to prevent TDV, how to respond if violence occurs, and how to seek help and support. The “Expect Respect” program involves parents in seminars, and the “Love is Respect” program shows the value of peer support by highlighting how friends can help.

Research on intimate partner violence has tended to ignore the younger end of the age spectrum, perhaps partly in denial of the intense relationships that are often formed at young ages. If these relationships are to be loving, rewarding, and fulfilling to those involved, it is imperative that

TDV prevention programs are established effectively with access available to all.

TERRORISM/TERRORIST ATTACK

Terrorism is crime with a political motive. It may be committed by lone individuals or by groups, whether well or poorly organized. Terrorist attacks may be directed at specific individuals, such as political, military, or corporate officials, or others who stand for a hated enterprise, such as abortion doctors, or they may attack indiscriminately people in crowded areas. In the latter case, the overwhelming motive of terrorist attacks is to inflict as much damage or injury as possible.

Terrorism as Ideology

It is a common misconception that the motivation of terrorists is what sets them apart from others who use extreme violence. Although in a general sense the idea that Islamic extremists, far right militias, or Marxist guerillas inflict violence in the service of their "higher" cause, these broad motivations may be better perceived as (1) justifications (rather than explanations) for what they do and (2) expressions of their belief that violence is the most effective means of achieving their distant goal, which is usually toppling a government or forcing an opponent to stop what it is doing (e.g., get the United States to leave Iraq or get researchers to stop using animals for experimentation). Most terrorist groups disintegrate within 12 months of their inception, indicating that the level of violence needed to change a regime is difficult to maintain.

Terrorism as Crime

A useful way to understand terrorism is to think of it as crime. In fact, the words *crime* and *terrorism* encompass a diverse range of events. Consider the possible range of acts that are subsumed under the heading of crime: murder, rape, theft of many kinds (e.g., embezzlement, shoplifting, pickpocketing, employee theft, credit card fraud, consumer fraud, identity theft, bank robbery, mugging, burglary, and car theft), extortion, kidnapping, drug dealing, smuggling, human trafficking, prostitution, child abuse, and many more. The range of terrorist attacks not only includes all these crimes

but also counterfeiting (of passports, identity papers, and currency), money laundering, suicide bombing, assassinations, roadside bombs, and arson. The supposed differences between terrorism and crime are that terrorism is more planned, of a larger scale, committed by groups, and the actors are more determined as they pursue a higher cause. However, bank robbery requires considerable planning, much crime is done in groups, frauds such as the Enron scandal have numerous victims, both offender and terrorist must be determined to complete a mission successfully, and many terrorists do not pursue a “higher cause” but do it for excitement, prestige, and money for support of themselves and their families.

Terrorism as a “Rational Choice”

Whatever the general motivation (whether frustration, hatred, greed, religious and ideological extremism, or materialistic and other rewards), to carry out a criminal or terrorist act, the *immediate* motive is to complete the operation successfully. To do so clearly requires planning and the corresponding series of decisions that are needed to implement any plan. The overall motivation may be irrational and the perception of reality may be distorted, but choices must be made within the environment as perceived by the terrorist. The field of situational crime prevention—well supported by extensive research—provides a way to identify the kinds of decisions terrorists make by focusing on the opportunities open to them. Applied to terrorism, four components of opportunity can be identified: targets, weapons, tools, and facilitating conditions.

Terrorism as Opportunity

Targets

Thieves do not steal everything. They steal only those products or services that are attractive to them, products that are CRAVED: Concealable, Removable, Available, Valuable, Enjoyable, and Disposable. In theory, thieves could steal anything. In practice, they must make choices. Terrorists are constrained by the same principle. In theory, they could attack anywhere, any time. In practice, they

must choose their targets carefully. The attractive characteristics of targets to terrorists may be summarized as EVIL DONE:

Exposed	The Twin Towers were sitting ducks
Vital	Electricity grids and transportation systems are vital to all communities
Iconic	Of symbolic value to the enemy (e.g., Statue of Liberty)
Legitimate	Terrorists’ sympathizers cheered when the Twin Towers collapsed
Destructible	Twin Towers were thought to be indestructible by a truck bomb
Occupied	Kill as many people as possible
Near	Within reach of terrorist group, close to home
Easy	Murrah building in Oklahoma City was an easy target for a car bomb placed within 8 feet of its perimeter

Weapons

As with targets, terrorists favor certain weapons over others. Most terrorist attacks are conducted using small arms and bombs. Attacks with weapons of so-called mass destruction (biological or nuclear) have been few and, where conducted, of limited effect. The characteristics of weapons that make them appealing to terrorists are MURDEROUS (see top of next page).

There will almost always be a trade-off between the target of choice and the weapon. If a target is particularly desirable, there may be a search for an appropriate weapon. For example, the first attack on the U.S. World Trade Center used a truck bomb parked under one of the towers. Although it did much damage, it failed to destroy the target, which true to its reputation, was considered indestructible. The second attack used a new weapon, passenger jets as missiles,

Multipurpose	A high-powered rifle has a specific use, whereas explosives have a much wider application.
Undetectable	Semtex, a plastic explosive, is small, lightweight, and largely undetectable, ideal for penetrating layers of security.
Removable	The weapons of terrorism must be portable, so they must be relatively light and reasonably small.
Destructive	Explosive devices have a greater kill rate than guns targeted at specific individuals.
Enjoyable	Terrorists are clearly attracted to their weapons, as are many ordinary people.
Reliable	If terrorists have used a weapon, or one like it, many times before, they are likely to favor that weapon over another.
Obtainable	How easy is it to get the weapon? Can it be bought or stolen easily? Or can it even be manufactured in-house?
Uncomplicated	All weapons require practice and training. A weapon that demands considerable skill, such as a free-flight armor-piercing missile, will rarely be used.
Safe	The use of bombs as weapons is inherently more dangerous than the use of guns, especially when made in-house.

which was successful. The planning required to use this new weapon was extensive and took years to accomplish.

Tools

Without the tools of everyday life, it is much harder for terrorists to reach a target or use their weapons. For many common attacks, such as car or truck bombings, drive-by shootings, and targeted assassinations, terrorists are likely to need most of the following:

- Cell phones or other means of communication
- Cars or trucks to transport themselves and weapons
- Cash or (false) credit cards; false documents—for example, drivers' licenses, passports or visas, and vehicle registration documents
- Maps, plans, addresses, photographs, and other information about the target

Doing terrorism is demanding of the tools of everyday life. These tools are certainly widely available, but their visibility is also considerable. Using cash instead of a credit card to rent a car, for example, draws unwanted attention to the offender.

Using a credit card exposes one's identity—unless it is stolen.

Facilitating Conditions

Targets, weapons, and tools exist within physical, economic, and social environments. At particular points in time or in particular regions or places, conditions may develop that facilitate the terrorist's ability to exploit these opportunities. These conditions make it ESEER for terrorists:

Easy	When local bureaucrats are susceptible to corruption
Safe	When ID requirements for monetary transactions are inadequate
Excusable	When family members have been killed by local anti-terrorist action
Enticing	When local culture/religion endorses heroic acts of violence
Rewarding	When support for new immigrants is available from local charities

Other more general facilitating conditions include the worldwide marketing of small arms whether legal or illegal, porous borders between countries making movement of terrorist operatives easier, and the proliferation of nuclear technology and materials creating opportunities for terrorists to obtain weapons of mass destruction.

Preventing Terrorist Attacks

Reducing Opportunities

The foregoing suggests that the obvious response is to reduce the opportunities for terrorists, making it harder for them to plan and carry out their attacks. There are four basic approaches to reducing opportunities for terrorism: (1) increase the effort involved, (2) increase the risks of failure, (3) reduce the rewards of terrorism, and (4) remove provocations and excuses. Examples of the kinds of responses that might be employed within this framework are as follows:

1. Increase the effort
 - Prioritize targets for protection; build walls and barriers.
 - Restrict sale of weapons or locks and immobilizers to make weapons difficult to use.
 - Hold contractors liable for stolen explosives.
 - Reduce the supply of large value bank notes; high tech passports, visas, and driving licenses; national ID cards; and parts marking on all tools, and make cell phones and other tools unusable without ID to unlock.
2. Increase the risks
 - Strengthen surveillance through closed-circuit television (CCTV), citizen vigilance, and hot lines.
 - Use radio-frequency identifications (RFIDs) to track weapons and to increase Internet surveillance of terrorist groups.
 - Tighten identity authentication procedures, and tighten border controls.
3. Reduce the rewards
 - Bomb-proof buildings, wear Kevlar vests, and employ swift cleanup of attack site.

- Use publicity to portray hypocrisy and cruelty of terrorist acts.
4. Reduce provocations and excuses
 - Build unobtrusive public buildings at home and abroad.
 - Avoid use of controversial weapons such as phosphorous bombs.
 - Maintain positive relations with local immigrant groups.
 - Avoid maltreatment of prisoners, and establish clear rules for interrogation.

Of course, these general responses would have to be adapted to the specific kinds of terrorist attacks that may be anticipated.

Anticipating Terrorist Attacks

The first concern is whether the attack is likely to be from a foreign-based attacker (foreign terrorism) or from within, usually called domestic terrorism, and whether there are targets that are close to known bases of terrorist operations. If the latter, then the attacks are likely to be frequent (assuming local facilitating conditions). If distant, they are likely to be rare but spectacular.

The role of intelligence here is important, but it is useful only if used in the service of finding out how terrorists carry out their attacks, their planning, the tools and weapons they prefer, and the local facilitating conditions that they exploit. This does not mean making lists of other suspected terrorists to construct an impressive but always speculative diagram of a terrorist network. Rather it means learning to “think terrorist” in order to anticipate their innovative capacities, whether they will turn a seemingly inoffensive tool into a mighty bomb, as they did with airliners in 9/11. The 9/11 Commission called this approach “thinking outside the box.”

Risk Assessment

An important part of anticipating a terrorist attack is to assess systematically the targets that are at risk. This is achieved by evaluating the *vulnerability* of each target (the chances that it will be selected by a terrorist) and the *expected*

loss (damage and injury for the short and long term) should it be attacked. EVIL DONE is a way to classify target characteristics according to both vulnerability and expected loss. Although all eight characteristics of EVIL DONE assess vulnerability, four—Vital, Iconic, Destructible, and Occupied—also provide assessments of expected loss.

Mitigation of Terrorism

Planning for prevention logically leads to planning for mitigation. Risk assessment forces us to think about how an attack might unfold, which logically leads to what kind and how much injury and damage may result. It follows that disaster management teams should be closely involved in the prevention planning described above, as well as in the standard recovery and cleanup that is the central role of disaster management.

Partnerships and Dual Benefits

Businesses are often the direct or indirect victims of terrorist attacks, and they often have the special expertise needed to assess risk and how to mitigate it in relation to their own enterprise. Informed counterterrorism policy, therefore, encourages businesses, policing organizations, and others involved in security to see that increasing security against terrorist opportunity can often have dual benefits. For example, restricting access into high-risk buildings not only restricts access to terrorists but also to thieves.

Government Policy

It is an important role of government at the local level to bring together businesses, local police, as well as fire and emergency management teams to coordinate their planning and their responses should an attack occur. In open societies with complex layers of government that are intertwined with private enterprise, a coherent national terrorism policy is essential for prevention. These layers of government should be encouraged to think about vulnerabilities in their particular spheres of responsibility. For example, a municipality must ensure that the local schools,

reservoirs, malls, and entertainment venues have developed contingency plans. In this way, responsibility *cascades* down from central government to involve every government level below.

THEFT

See Larceny/Theft

THIRD-PARTY LAWSUITS

Third-party lawsuits allow injured persons to sue “third parties,” entities who are not directly responsible for the injuries sustained by the individual. Although these lawsuits can involve any type of third party, state and federal courts have seen increasing numbers of third-party lawsuits involving three issues. The first involves insurance companies that do not pay (or underpay) for damages caused by the insured. The second involves

lawsuits that are filed when a worker is injured on the job. The third involves victims of crime who file lawsuits against those who they feel are indirectly responsible for their victimization. All of these are discussed below.

Regarding insurance companies, many people have filed lawsuits against insurance companies for inadequate compensation for injuries. For example, if a person is injured in a car accident and the other driver is responsible, the injured party may file a lawsuit against the responsible party's insurance company if that company is slow to pay for damages or has provided inadequate compensation. In this example, the insurance company was not directly responsible for the injuries sustained in the car accident, but it could nonetheless be involved in a third-party lawsuit for its negligence in failing to provide adequate compensation.

Regarding those who are injured on the job, a factory worker may be injured when the safety feature on a piece of equipment fails to work properly. In this situation, the worker may file a worker's compensation claim against the employer to receive damages for the injury. In addition, the worker may sue the manufacturer of the equipment because it failed to work properly. Suing the manufacturer would be an example of a third-party lawsuit.

Regarding crime victims, a victim may sue any number of third parties for indirect involvement in a crime. For instance, a victim of an assault in an apartment building may not only bring charges against the perpetrator in criminal court, but he or she may also sue the landlord of the building for failure to provide adequate safety measures. Suing the landlord would be an example of a third-party lawsuit. Other entities such as schools, hospitals, and merchants have been parties in third-party lawsuits for providing inadequate security.

A current issue regarding crime victims and third-party lawsuits involves suing gun manufacturers and sellers for crimes committed with guns. This is a hot-button topic, as numerous states and the federal government have attempted to pass legislation to prohibit such lawsuits. It is argued that gun manufacturers should not be held responsible for the use of a gun during a crime since guns can be obtained legally, even if they are used for

illegal purposes. In effect, gun manufacturers have no control over how guns are used. Opponents of such legislation argue that holding gun manufacturers responsible is akin to holding manufacturers of defective equipment responsible: If the equipment harms another, then the manufacturer should be held responsible.

When filing third-party lawsuits, the burden is on the plaintiff (the individual filing the lawsuit) to prove actual negligence on the part of the respondent. In the example of the assault above, the plaintiff (the crime victim) must show that the landlord knew of lax safety features (e.g., broken locks on doors or disabled security cameras) and chose not to remedy them. In this instance, the landlord was negligent and, therefore, could be sued by the crime victim.

Supporters of third-party lawsuits argue that they empower victims, in that they know that some sort of avenue exists to help remedy the effects of their victimization. This is especially true if the actual offender in the case is never caught, is acquitted, or receives some sort of token punishment. Supporters also contend that these lawsuits send messages to other potential third parties. By drawing attention to those who are indirectly involved in crimes, third-party lawsuits can help improve safety and protect the lives of potential victims.

Critics of third-party lawsuits contend that these lawsuits do nothing but line the pockets of attorneys who are litigating the cases. Critics argue that, since these lawsuits can be expensive for third parties, attorneys are the true victors in these cases, beneficiaries of these "deep pocket" lawsuits. Additionally, the ability to file third-party lawsuits may result in frivolous claims that have no standing, which can encompass a large amount of a court's time and resources. Finally, when third parties like insurance companies are sued, the costs of the lawsuit are passed on to consumers, who must pay higher premiums to compensate for the financial losses of the company.

THIRD-PARTY POLICING

Third-party policing encompasses a variety of pressures applied against nominally respectable citizens to enhance informal social controls. In its broadest forms, third-party policing invokes civil processes and other sanctions against place managers to compel participation in police-directed anti-crime initiatives. Originally described as “policing *through* third parties [emphasis added],” it is inherently coercive, becoming the policing *of* third parties when persuasion fails to achieve desired goals. Those who are subject to third-party policing tactics are only the *proximate* targets of police action. The *ultimate* targets remain the criminal element.

The most common form is the coordinated application of civil codes and regulatory laws that ordinarily lie outside the police mandate. Those targeted by third-party policing have broken no criminal laws, but they contribute to the spread of criminogenic conditions by being derelict in other responsibilities. Under police direction, civil sanctions are used as leverage to change specific conditions identified as criminogenic. Against claims of “no responsibility” or “limited liability” based in the canons of private enterprise, third-party policing asserts that owners and managers have a burden of social responsibility to their neighbors.

Most community crime prevention initiatives first assemble a coalition of neighborhood residents, breaking down anonymity and establishing a basis for trust and collective action. Major goals are to establish a sense of community and to initiate surveillance to advance territoriality. Sustained efforts require mobilization of resources beyond the capacity of the residents themselves: the assistance of stakeholders who own businesses and

property in the area but do not live there; enhanced services from public sector agencies; increased or nonroutine attention to problem establishments by regulatory agencies; and resources from private foundations and other sources. Their participation enhances community efficacy and the neighborhood’s social capital.

Creating coalitions requires three main tools: information, persuasion, and coercion. Mobilizing residents is limited to providing information and persuasion. Those tactics are also the first resort in attempts to enlist nonresident stakeholders and guardians, many of whom respond positively when presented with evidence of need and a clear course of action. Coercion is employed only when persuasion fails, and it is generally limited to targets whose actions or inaction contribute directly to unsavory conditions in the neighborhood.

Landlords, bar owners and managers, and other guardians hold a limited power over some part of the offending population’s lives. It is not as drastic as the application of criminal sanctions, but it is more immediate and consistent; thus, it is thought to be more effective.

Police requests for assistance reflect the role a property plays in community problems. The generic term for such places was “attractive nuisance,” but the problems that a mismanaged property creates often are far more serious. Bars may serve as gathering places for drug dealers, purveyors of stolen property, prostitution rings, and other criminal elements. Liquor stores and bars with lax service rules sell to minors, to the already inebriated, and to those whose subsequent uncivil conduct ranges from disorderly behavior to vandalism to assaults.

Landlords who fail to establish rules of conduct for their tenants have no means of controlling noise, boisterous behavior, and other activities that disturb the neighborhood. They may uncritically accept drug dealers as tenants, ignoring collateral incivilities that come with high-volume drug sales on the premises or nearby. Owners of vacant buildings (or apartments) may fail to secure them against intrusion and conversion to illegal use (shooting galleries, illicit squats, and prostitution). Decrepit buildings and unkempt properties give the impression of decay, inviting incivility.

Police requests for changes in managerial practices or for upgrading physical premises frequently are met with resistance. Inevitably the changes incur a financial burden against the owner's bottom line. Outright refusal, foot-dragging (including lies), sham alterations, and counteroffensives using political allies are common forms of resistance.

Third-party sanctions can be relatively benign, such as the inconvenience of unannounced health and other code inspections. Although financial burdens result, they are generally light. When inspections are conducted outside the normal routine of advance notice and superficial measures to ensure license renewal, the real message is that police requests are not to be ignored.

In the middle range, sanctions can entail civil abatement measures, a more formal and stringent application of the civil laws. These tend to be more expensive and entail the threat of more drastic measures unless full compliance is forthcoming. The Oakland (California) SMART program directed at drug-dealing locations is a prime example of a coordinated civil abatement effort. Many other tools of civil abatement exist; however, liquor-selling establishments are subject to state licensure and local permits, either of which may be suspended or revoked. In many municipalities, rental properties require local licensing, which serves as another venue for bringing pressure on recalcitrant landlords.

For extreme problems, businesses may be closed and properties may be seized and forfeited. The most serious penalties are generally related to drug trafficking, for which asset forfeiture is prescribed by law. Because of the level of proof and efforts involved, this option often is reserved for the most dramatic offenders.

When necessary, third-party policing also invokes political pressure against underperforming public agencies. Because such efforts upset the normal balance of civility and deference to routine operations, they require extensive documentation and illustration of the need for different approaches. The process is easiest in areas where transparency is established and most difficult in those jurisdictions where personal loyalties transcend the public process.

The phrase *third-party policing* implies that these measures are police tactics, and in most

instances, the police have been the catalysts to bring focus to civil authority on criminal or criminogenic problems. Other models are possible, however; community activists have forced changes in the business practices of licensed liquor establishments and have sued owners of drug locations to force closures. With or without police leadership, the principle is the same: Civil law and regulations are important tools for controlling crime.

THREAT ASSESSMENT

After Tatiana Tarasoff was killed by a jilted suitor who disclosed his intentions in treatment prior to killing her, the California Supreme Court concluded that the psychologist and supervising psychiatrist should have warned her of the pending danger and were compelled to protect her. They were found liable for not doing so (*Tarasoff v. Regents of University of California*, 1976). This legal decision profoundly affected the practice of mental health professionals, requiring that treatment providers gain skills to assess and predict potential violence posed by patients. A clarion call for better assessment tools to evaluate violence risk was sounded after this decision. A potential danger taking many forms (e.g., child sexual abuse, intimate partner violence, and workplace violence), today's violence risk assessment is typically accomplished by both actuarial and clinical methods, a combined approach.

Criminal Recidivism and Violence

Persons who reside in correctional facilities or inpatient psychiatric hospitals (forensic or civil)

are often assessed with the valid and reliable HCR-20, a tool designed for predicting criminal recidivism and violence. The evaluatees typically have mental illnesses and/or personality disorders with histories of violence. The evaluator investigates the parameters of risk posed by an individual who is being considered for release. The HCR-20 calls for systematic assessment of various factors or areas of inquiry. Ten of the areas are historical in nature (*H*); that is, they are facts about the evaluatee's life, biographic data from personal history, and other "static" factors that cannot be changed. They include the following: a history of violence; age when first violent; stability of interpersonal relationships; employment history; substance use history; mental illness history; presence of psychopathy (e.g., arrogance, shallow emotions, lacking empathy, little remorse for wrongdoings, thrill seeking, and lacking feasible future plans); history of early maladjustment (e.g., diagnosis of conduct disorder); diagnosis of personality disorder (e.g., antisocial or borderline); and prior supervision failure (e.g., probation or parole violations). Five areas of inquiry are more focused, "fluid," and amenable to change, pertaining to the evaluatee's present clinical functioning (*C*): insight the evaluatee has about his or her mental condition; the evaluatee's attitudes about violence; expression of mental illness symptoms (e.g., hallucinations or delusions); evidence of impulsivity; and response to treatment. The last five areas of inquiry are future oriented and concern likely adjustment after release, labeled "risk management items" (*R*). They include assessment of the evaluatee's plans after release (e.g., relapse prevention); "destabilizers" the evaluatee will confront after release (e.g., returning to a drug-infested neighborhood or a querulous home); nature of social support after release; whether the evaluatee agrees with the remediation plans; and how likely is adherence to such recommendations.

Twenty areas of focus across *Historical*, *Clinical*, and *Risk management* domains (HCR-20) are rated on a three-point Likert scale (0 for absent, 1 for maybe present, and 2 for definitely present). A total score can be generated after completing the HCR-20, and it can be compared with data gathered across multiple settings (e.g., correctional, forensic psychiatric, and civil psychiatric). Many violence risk evaluators use the HCR-20 as a

model or heuristic, a guide to focus their inquiry, ensuring no critical area correlated with violence risk is neglected.

Sex Offenders

When the United States Supreme Court ruled in *Specht v. Patterson* (1967) that courts can enhance sentences for specific crimes if the guilty party is deemed a "sexual offender," and in *Kansas v. Hendricks* (1997) that defendants deemed to be "sexually violent predators" could be detained indefinitely, well beyond the years specified for incarceration, these cases spawned development of valid and reliable assessment tools specific to sex offenders. Phalometric measures (e.g., penile plethysmograph) were shown to be a strong predictor of sexual criminal recidivism. Yet, specific factors were also shown to correlate with sex crime risk, including juvenile antisociality, criminal and sex offense history, young age, psychopathy or personality disorder, alcohol abuse, extrafamilial victims, and reports of having been abused as a child or of having lived apart from one's parents as a child. This knowledge led to the development and use of assessment tools like the Static-99 and the Sex Offender Risk Assessment Guide (SORAG), which was employed with adult sex offenders pending release from incarceration or structured treatment settings. Some areas of focus include the nature of both sexual and nonsexual convicted offenses; specific characteristics of their victim(s); history of conditional release violations (e.g., probation, parole, and no-contact orders); their age at the time of the sex crime; diagnosis of personality disorder; a diagnosis of schizophrenia (interestingly, which is negatively correlated with risk); and presence of psychopathy. Total scores on the Static-99 and SORAG yield a probability of recidivism that can be compared against norms collected on released sex offenders.

Special Applications and Further Considerations

Many instruments have been designed to gauge risk across multiple domains (e.g., domestic violence, workplace violence, and school violence). It should be cautioned that there is no set and determinative profile for who will or will not become

violent. When assessing individuals who fit patterns of known violent perpetrators, remember that if the specific violence base rate is low (e.g., school violence), then one will inevitably identify many persons as being at risk for violence when, in fact, they are not a risk (false positives). Considering the negative stigma of such a label and perhaps even deprivation of one's civil liberty (e.g., losing a job, removal from school, and civil commitment to a hospital), this field of assessment has shifted its emphasis from violence prediction to risk management. The focus on preventing violence by identifying specific areas of risk and bringing resources to bear to reduce that potential for violence is clearly perceived as the best of evidence-based practices.

TOURIST CRIMINAL VICTIMIZATION

Tourism and crime has many dimensions. Although some crimes are committed by tourists, that is, when those on vacation commit crimes or when criminals focus on tourist destinations to commit crimes, of more general interest, some crimes are committed against tourists. It sometimes happens that the perpetrators are other tourists, but more frequently, crimes against tourists are committed by predatory residents of the locale visited. This definition does not include fraud inflicted on tourists by airlines, travel agents, and merchants at destination businesses.

Crimes Committed by Tourists

Crimes committed by tourists include conventional crimes such as pickpocketing, burglary of hotel rooms, or even professional burglary committed by touring professional criminals, illegal sex tourism (e.g., when European and North American males become sexual predators on children in Third World countries), and drug tourism (when foreign nationals visit certain countries or areas where drug laws and enforcement are lax to use illegal drugs). Sometimes crimes of violence, usually involving alcohol, are committed by tourists in destination countries, cities, or on cruise lines. An example would be drunken fighting and indecent public behavior by American students on high-school trips at Caribbean and Mexican resorts. Other crimes might include environmental crimes such as damaging national parks and environmentally sensitive areas.

Crimes Against Tourists

Tourist criminal victimization is considered to be crime against tourists by local inhabitants at the destination site or resort. Its amelioration would involve local law enforcement efforts and engaging the tourist industry to prevent and deal with the results of crimes committed by predatory local criminals. Tourists are particularly attractive targets as they dress distinctively and are easy to spot by potential predators. Additionally they often stop while walking on the street or in rented vehicles to consult maps and tour books, making them both visible and vulnerable to the mobile criminal. Areas near airport auto rental sites and highway rest stops are hot spots for predators on the lookout for vulnerable tourists in automobiles. In addition, tourists are particularly profitable targets because they often carry expensive hardware such as cameras, expensive watches, and jewelry on their persons, and they often carry large amounts of cash and marketable items like passports. An important consideration for the criminal is that tourists as victims typically react in a way that hinders law enforcement. For example, instead of calling police after a pickpocket incident, they often return to their lodgings to look for the missing items, thus losing critical response time and increasing the criminal's chance of successful escape. Tourists

frequently do not speak the language of the tourist country, and they do not understand local police practices and legal procedures. Additionally, sometimes tourists were involved in illegal activity when they were victimized, such as drug use or transactions with prostitutes and are hesitant to involve the police. Criminals are also well aware that tourists are unlikely to return from their home countries for trials, particularly when the amount of money or monetary value of the item is small. When they arrive in the host country, tourists are often exhausted from jet lag and travel—and the fact of a crime victimization, and of concomitant loss of identity documents, credit cards, and possessions renders them helpless. They cannot rent cars, obtain food, get a hotel room, or even return home as they have no proof of identity. If they have been the victim of sexual offense or routine violent crime, they are frequently in a state of almost complete demoralization. The simple theft of a camera from a beach blanket can spoil an entire vacation: A notable crime of violence can scar a life and create ruinous publicity in the tourist's home country.

Florida: When Crimes Against Tourists Damage Tourism

The state of Florida's tourist industry was seriously affected in the early 1990s by a series of crimes against European tourists that was highly reported in international media. Florida had a peculiar crime category in its crime reporting system, "crime against visitors," which although useful in getting police to focus on crimes against tourists, also allowed media, government, and academia access to examine and assess the situation easily. After the initial panic was over, Florida quietly discontinued this crime category, thus hampering efforts to assess the success of ameliorative programs. Of major concern was the practice of young criminals haunting airport areas and tourist rest stops looking for tourists to victimize. Targeting rental cars by means of decals on the windshield or special plates, these offenders created a reign of terror killing nine tourists from 1992 to 1993. Noting media response and a small but perceptible fall in tourism, police and the industry responded with heightened patrols of rest stops and airport-to-resort corridors as well as with special signage, and they created brochures and Web sites with

crime and crime-reporting information for foreign visitors. Police also created special multilingual victim response teams to deal with international crime victims as well as special teams to target predatory resort criminals. Hotels and resort employees were also given tips about how to recognize suspicious individuals, how to prevent crime against tourists, and how to help tourist victims. The tourist industry reacted in concrete ways: Obvious decals and identifying plates on rental cars were prohibited and removed. In addition, juvenile criminals were targeted and prosecutors made special efforts at obtaining convictions against those who were accused of committing crimes against tourists. "Fly back" programs were created to bring crime victims to court from their distant homes. The state claimed a purported 60% tourist robbery reduction in Greater Miami since these programs began in 1994.

TREATING RAPISTS/SEX OFFENDERS

Since the late 1990s, the release of sex offenders to the community has generated a great deal of

controversy. In many states, the correctional response to sex offenders has been primarily punitive in nature with legislation focusing on punishment, monitoring, and restrictions. Nevertheless, numerous correctional departments across the United States and the Canadian correctional system have established prison-based therapeutic programs to address the treatment and rehabilitation of sex offenders. Current correctional treatment has been primarily developed for child molesters and is of a relapse prevention perspective; however, rapists and child molesters exhibit differences in psychological, social, and behavioral factors, such as psychopathy and recidivism. As such, treatment for child molesters is likely to be ineffective with rapists. Correctional treatment should be modified to target multiple and different problems for rapists and child molesters.

Sex Offender Treatment

Current treatment strategies for sex offenders are primarily based on a cognitive-behavioral treatment (CBT) framework with a particular focus on relapse prevention (RP). The primary goal of CBT is development of the mental skills necessary for individuals to control their own behaviors. CBT with correctional populations has been conceptualized as cognitive restructuring, cognitive or coping-skills development, and life skills training. The focus of treatment is on restructuring the cognitive distortions and dysfunctional thought processes of the offender that lead to inappropriate, deviant, and illegal behavior.

CBT for sex offenders targets the cognitive distortions (commonly referred to as “thinking errors”) surrounding deviant sexual fantasies and patterns of arousal that contribute to sex offending. Offenders learn to recognize the cognitive distortion process, and they identify specific distortions in which they engage, such as minimization, justification, rationalization, and externalization, to mitigate culpability. Specific treatment aims include aiding the offender in identifying the continuous conflict cycle that leads up to offending behavior and that may bring about future sexual deviance. Offender awareness of these thought processes is critical to developing motivation and desire to change. Treatment strategies focus on substituting maladaptive and deviant sexual thoughts with healthy sexual attitudes and beliefs. In addition to

group discussion, role-playing is a critical component of sex offender treatment. Role-playing helps offenders develop prosocial coping skills and techniques to deal with the stressors that contribute to the sex offending cycle. Additionally, the offender is challenged to accept responsibility for his crime and to empathize with his victim(s). The RP component helps the offender identify the situations (“triggers”) that place him at risk for sex offending and teaches strategies to cope with these high-risk situations and gain control of his antisocial behavior. In short, CBT programs provide the sex offender with the opportunity to gain self-awareness, change deficient thought processes, and acquire the necessary tools to help him eschew deviant sexual behavior.

The evidence on the efficacy of sex offender treatment programs remains equivocal. Although meta-analyses suggest a moderate treatment effect on sex offender recidivism, almost all qualify their findings by noting the lack of scientific rigor in existing studies. Furthermore, in the only randomized trial of treatment for sex offenders to date, the authors found that inpatient relapse prevention treatment for sex offenders produced no significant effect on recidivism.

One possible reason for these differential effects is that most correctional programs include a mixed group of sex offenders in treatment; however, research indicates that sex offenders constitute a heterogeneous group. More specifically, rapists and child molesters exhibit some clear psychological, interpersonal, and behavioral differences. Rapists, on average, tend to be more antisocial and aggressive and can be more accurately classified as violent offenders rather than as sex offenders. Child molesters are generally nonviolent, their sexual deviancy is often considered pathological and entrenched, and their criminal behavior is driven by their sexual preoccupations. Unfortunately, empirical findings related to such distinctions have rarely translated into modifications to sex offender treatment programs that address the differential needs of subgroups of sex offenders.

Differences in Social, Psychological, and Behavioral Manifestations of Rapists and Child Molesters

The literature points to significant disparities between rapists and child molesters on a constellation

of interpersonal, affective, psychological, behavioral, and attitudinal attributes, including antisocial orientation and attitudes, juvenile delinquency, juvenile and adult antisocial behavior, criminal associates, criminal career, nonsexual violent offending, age of onset of criminal offending, fixation with children and/or deviant sex-related behavior (e.g., paraphilias), psychopathy, cognitive distortions, aggression levels, antisocial personality disorder, alcohol abuse/dependence, depression and anxiety, borderline disorder, treatment completion, treatment success, level of denial, blame attribution, hostility, social alienation, self-centeredness, impulsivity, inhibition of aggression, aversion to violence, feelings of inadequacy, insecurity, and heterosexual skills. Child molesters are distinguishable from rapists and other non-sex offenders on the basis of their attitudes and beliefs about sex with children. Studies examining cognitive distortions indicate that child molesters have thoughts and fantasies related to children specifically and that they view children (relative to adults) as significantly more sexually attractive. Child molesters are also more likely to perceive children in sexual terms, view sexual contact with children as being socially acceptable, and tend to minimize the harm they cause to children. In contrast, deviant sexual interests in rapists are more ambiguous and inconsistent than for child molesters.

The cognitive distortions commonly identified in rapists are distinguished from those of child molesters as “broader” in focus and related to aggressive behavior generally. For example, rapists display greater hostility toward women (e.g., view women as untrustworthy, exhibit distrust and/or disrespect for women, and blame the victim for their violent behavior) than child molesters and are more likely to view women as sex objects. Overall, there are differences in sex-related beliefs where child molesters display cognitive distortions involving sexual activity with children, whereas rapists seem indiscriminate from the general prison population and, more precisely, nonsexual violent offenders in their thought processes.

For rapists, sexual aggression does not result from specific deviant sexual attitudes, but it is part of an overall negative and antisocial lifestyle. This is manifested in the offense motivation of sex offenders. Classification systems and taxonomies suggest that offense motivation varies between

child molesters and rapists. Child molesters seem to be motivated by the sexual aspects of the offense, whereas rapists are more often motivated by violence and anger. The motivation behind the sex offending of rapists may be related to a strong aggressive nature and a need for power and control, which could be satisfied through a sexually violent assault. Molestation of children has historically been viewed as a mental health problem rather than as part of a criminal lifestyle, as evidenced by the existence of a pedophilia disorder in the *Diagnostic and Statistical Manual of Mental Disorder*, fourth edition. The clinical perspective and attendant research raise the plausibility that the sexual aggression of rapists is not pathological but one manifestation of their generally impulsive antisocial tendencies and behaviors. From this standpoint, those who sexually assault adult women are generally violent men who happen to commit a crime of sexual violence.

Much of the diversity between rapists and child molesters seems to relate to clinical features of psychopathy. Psychopathy is viewed as a serious personality disorder that manifests itself early in life and, in most cases, persists throughout the life span. Psychopathy is associated with a constellation of affective, interpersonal, and behavioral attributes and is significantly related to recidivism. Characteristics that distinguish psychopathic personalities include grandiose, manipulative, unable to form strong emotional bonds with others, lacking in empathy, guilt, or remorse, irresponsible, and impulsive behavior. Rapists have higher rates of recidivism than child molesters and are much more likely to be classified psychopathic than child molesters. Furthermore, rapists have a higher degree of aggression and more chronic, antisocial lifestyles than child molesters. In sum, rapists exhibit a considerably higher prevalence of psychopathy than child molesters.

Evidence-Based Practice Sex Offender Treatment

In developing more effective sex offender treatment, it is important to examine variables that differentiate sex offenders who primarily violate against children from primary rapists. We cannot presume that what works for one will work for all,

provide less than adequate or irrelevant programming, and then hold the offender solely accountable for his failures. Rapists and child molesters have widely varying treatment needs; yet, sex offender programming has been developed principally to meet the needs of child molesters (e.g., in most sex offender treatment programs the focus is on sexual deviance particularly related to paraphilias and sexual preoccupation with children). Many sex offender programs are not adequately equipped to treat and manage offenders with high levels of aggression such as those displayed by rapists. Sex offender treatment programs are generally a one-size-fits-all intervention for a hodgepodge of sex offenders. Failure to develop correctional rehabilitation programs for rapists, a group of offenders with considerably high rates of recidivism and violent offending, poses a great risk to public safety.

The dual focus of current CBT programs for sex offenders is on sexual deviance and cognitive distortions related to sexual thinking patterns. However, research indicates fundamentally distinct personality and behavioral traits between rapists and child molesters in these and other areas. The differences between rapists and child molesters and the lack of distinctiveness when rapists are compared with the wider population of serious criminal offenders have implications both for research and treatment. Addressing the differing levels of need and responsivity of sexual offenders is critical when planning strategies for their management and treatment. A more practical and effective approach would be to tailor separate treatment programs to the specific needs of rapists, such as issues related to treatment engagement and completion as well as psychopathy.

If one primary treatment objective is, at the core, to change the thoughts, behaviors, and predispositions that lead offenders to violate society's sexual norms and expectations and that increase their likelihood of recidivism, it is necessary to understand whether the thoughts of rapists are similar to those of child molesters. Correctional programs should aim to treat the motivational issues of rapists and cognitive distortion issues related to overt aggression and hostility toward women. Rapists may benefit more from programs for violent offenders or for criminal offenders in general. More broadly, non-sex-offender rehabilitation programs that focus on general cognitive

needs, such as attitudes supportive of antisocial behavior, the influence of criminal associates, substance abuse, developing a noncriminal identity, and a wider range of social skills, may increase the responsivity to treatment among rapists.

Conclusion

Differences in psychological characteristics and recidivism between groups warrant accounting for this distinction in designing appropriate treatment programming. Sex offender treatment programs primarily have been developed to meet the perceived needs of child molesters. This is problematic considering evidence-based practices dictate that treatment targets should be based on needs and responsivity and the literature reveals substantial differences in the criminogenic needs and response styles of rapists and child molesters. Sex offender treatment programs currently in operation place a strong emphasis on changing sex-related deviant attitudes, not antisocial attitudes in general. This focus on sexual deviance and preventing sex reoffending seems more adequate for child molesters, but it largely excludes developing awareness and skill sets in other areas that are predictive of general recidivism. This calls for alternative interventions for rapists specifically, and that treatment may need to be of different content, intensity, and/or duration for primary rapists when compared with offenders who primarily sexually violate children.

TREATING VIOLENT OFFENDERS

Because most offenders will return to society, one of the objectives of sentencing is offender treatment. While incarcerated, or in a community release program, treatment is often an integral goal of corrections. Violent offenders are those convicted of such offenses as robbery, sexual assault, and murder. Many of these offenders are recidivists, with a history of violence. Several of them have drug abuse issues as well. Thus, treating these offenders requires a comprehensive approach incorporating a variety of strategies. Cognitive behavior approaches along with medical interventions are often used in treating violent offenders.

It is reported that more than 600,000 offenders are released from state and federal prison annually. According to the Bureau of Justice Statistics (BJS), in 2006, approximately 60% of state prison inmates were there for violent crimes. Violent offenders are distinguished from other offenders by the psychological and physical injuries they cause, their motivation for violence (hatred, etc.), the methods of their offenses (use of weapons, physical force, etc.), and their acceptance for treatment or change. They also differ as to their histories of criminal behavior and their mental status. Many violent offenders have a criminal history and have undergone prior treatment programs either in prison or in a community release program. Unless on death row, sentenced to life imprisonment without the possibility of parole (assuming no pardon), or dying in prison, violent

offenders will eventually return to society. However, according to the BJS, more than 50% of those released from prison will be rearrested within 3 years after release. Thus, it becomes incumbent that those who are to be released undergo some form of treatment to reduce recidivism rates. But before we treat them, there is a need to understand what we are treating. And we need to understand the offender (background, etc.) to fully grasp his or her reasons for violence.

Understanding the Violent Offender

There is no shortage of theories explaining the sources or causes of violent behavior. Most theories addressing violence are grouped into theories such as biological, psychological, sociological, economic, and so forth. Unsanctioned violent criminal behavior is the result of several personal and social factors, including mental illness, childhood abuse and neglect, brain injuries, personality disorders, environmental toxins, drug abuse, and so forth. Others take the approach that antisocial behavior results from a series of evolutionary stages.

People become violent through a process called violentization, which involves four stages: brutalization and subjugation, belligerency, violent coaching, and criminal activity. First, this person is a victim of violence and feels powerless to avoid it. Then the victim is taught how and when to become violent and to profit from it. Then he or she acts on that knowledge. In other words, experiencing or witnessing repeated violence, particularly at a young age, often leads to violent acts in the future. It is a form of learning that has been addressed in the crime literature for many years. It is often said that yesterday's victim becomes the future offender.

Untangling the web of violent patterns and treating the violent offender requires an understanding of how he or she became violent in the first place. Is it the result of uncontrolled anger, hatred toward a particular group (hate crimes), feelings of social inadequacy or rejection caused by mental illness or learning disabilities, a lack of proper socialization, or a combination of several factors? Whatever the reasons for violence, the question remains as to what can be done to reduce recidivism rates and to help the violent offender readjust to society and reduce the victimization of others.

Treatment Approaches

Several treatment approaches are available for the violent offender. The approaches include psychological interventions, such as cognitive-behavioral therapy, medical interventions, or a combination of both. Not all offenders respond to the same treatment, nor do offenders require the same treatment strategies. A convicted sex offender may require different treatment than a drug offender.

Some offenders respond well to traditional group therapy, whereas others respond well to individual or one-on-one approaches. Others may not wish to participate in any treatment and just prefer to do their time. In any event, treatment for violent offenders must consider the offense, the offender's personality, age, mental state, and lifestyle characteristics. One size does not fit everyone. For some offenders, there is no treatment other than continued confinement because of the seriousness and repetitive nature of their crimes, or their disdain for treatment (e.g., mass murderers and serial killers).

Cognitive-Behavioral Therapy

Several types of psychological/ behavioral interventions are used in treating violent offenders. However, for the purposes of this discussion, one particular intervention proven successful for violent offenders is referred to as cognitive-behavioral therapy (CBT). This approach focuses on anger and emotions management and on problem solving. It is considered easier to use than traditional counseling, such as one-on-one therapy or group therapy, and correctional staff can be trained to conduct the treatment in a relatively short period of time.

Cognitive-behavioral therapy began in the 1960s to blend the elements of behavioral therapy and cognitive therapy. Behavioral therapy focused on external behaviors, and the cognitive approach focused on internal thoughts and mental processes. The combination of the two seeks to change an offender's irrational or faulty thinking and behaviors. Cognitive-behavioral therapy is also used to treat a range of mental conditions such as depression, anxiety, and bipolar disorders, which are often present in violent criminals. Thus, in working with the offender, there is a need to identify the source of irrational or violent thoughts, refute them, and help the patient to change.

According to Harvey Milkman and Kenneth Wanberg, a variety of cognitive-behavioral programs are used in corrections. One example is referred to as aggression replacement training (ART). This therapy is used in both juvenile and adult correctional settings. The therapy seeks to provide offenders with prosocial skills to use in antisocial situations as well as with skills to manage anger impulses that lead to aggressive and violent actions. The model includes social skills training, anger control training, and moral reasoning.

An abundance of research indicates the positive effects of cognitive-behavioral approaches with offenders leading to a reduction of recidivism. In a meta-analysis of 69 studies comprising CBT programs in corrections, it was found that recidivism was reduced by about 30% for treated offenders.

Cognitive-behavioral interventions are the most common form of treatment used with sex offenders. Aviva Moster offers evidence suggesting that treatment using CBT decreases subsequent sex offender recidivism. In summary, cognitive approaches seek to determine the source of violent thinking patterns and deviant rationalizations and to address ways in which to divert or modify those negative patterns.

Medical Interventions

The use of drugs for violent offenders is not uncommon, particularly for sex offenders. The use of drugs such as anti-libidinal medication and selective serotonin reuptake inhibitors (SSRIs) are commonly used along with CBT for sex offenders. Most states require convicted sex offenders to participate in treatment while in prison or on probation. According to some reports, there are 1,549 sex offender treatment programs in the United States. Most of them are community based (80%) with about 40% treating adults, and the rest target adolescents and children with sexual behavior problems.

One commonly used drug is cyproterone acetate, a steroid analogue first used in West Germany in 1961. The drug acts to reduce serum levels of testosterone. The main uses of this drug are the reduction of sexual drive. Another anti-libido drug used in the United States is called medroxyprogesterone acetate. This drug works by inducing testosterone in the liver, which enhances the metabolic

clearance of testosterone, reducing testosterone levels. These drugs are often used with other treatment approaches such as psychotherapy.

W. J. Meyer and others report a study of 40 men who were pedophiles and treated with medroxyprogesterone. They received a weekly dosage of 400 mg for periods ranging from 6 months to 12 years; the men also received group and individual psychotherapy. A control group of men who refused drug treatment but received psychotherapy were followed during the same period. The study revealed that 18% of those taking the drug reoffended (35% after it was discontinued), compared with 55% of those in the control group who did not take the drug.

As to the effectiveness of treatment for sex offenders and other violent offenders, more comprehensive programs as well as the length of time in treatment are important factors in treatment effectiveness. Treatment failure is associated with higher recidivism rates; however, violent offenders, including sex offenders, who successfully complete a treatment program reoffend less often than those who do not. Some sex offenders are more likely to recidivate than others. Studies that have tracked sex offenders over longer follow-up periods have found that pedophiles who molest boys and rapists of adult women were the types of offenders most likely to recidivate at rates of 52% and 39%, respectively. Repeat offenders are more likely to reoffend than first-time offenders.

Another medical approach in treating sex offenders is castration. A few states, including California and Florida, permit convicted sex offenders to be injected with Depo Provera, a birth control drug approved by the U.S. Food and Drug Administration. Often called *chemical castration*, Depo Provera does not render any permanent physical change to the body; rather, it is meant to quell the sex drive of male sex offenders by lowering their testosterone levels. The treatment is believed to be most effective on sex offenders who possess uncontrollable biological urges. The more radical approach of castration is voluntary surgical castration. For example, Texas permits surgical castration of offenders. By May 2005, three men had undergone the voluntary procedure. Candidates must be at least 21 years of age, have had at least two sex offense convictions, and have undergone at least 18 months of sex offender treatment,

including Depo Provera injections, to understand how their bodies might react with less testosterone. However, the effectiveness of castration has mixed results and definitely raises ethical questions on the extent of treatment.

Factors Necessary for Effective Treatment

For treatment to be effective for the violent offender, it must be tailored to the needs of the offender. Effective treatment must encompass a proper diagnosis, recognition of offenders as individuals, an understanding of problems versus symptoms, multimethod measurements of treatment progress, and quality treatment duration and intensity. A dedicated treatment staff is also necessary. Treatment for the sake of treatment is not the answer. Regardless of the treatment type, there will always be the risk of recidivism, especially for high-risk or repeat offenders. Quality comprehensive treatment programs can reduce recidivism rates. For many offenders, this may include cognitive-behavioral approaches as well as medical interventions. But for some offenders, the only effective response may be long-term incarceration (with or without treatment). Lengthy prison sentences serve as an aging out process for some. This is one of the arguments behind so-called three-strikes laws. Long-term incarceration, especially after conviction of a third violent crime, may result in a long-term prison sentence. After release, these offenders are too old or too weak to engage in violent crime.

U

UNIFORM CRIME REPORTING (UCR) PROGRAM

The Uniform Crime Reporting (UCR) Program, one of the oldest and most stable attempts to provide crime statistics for the United States, is essentially two distinct programs. It has been changing from a summary statistics program to an incident-based system since about 1980. In the older, summary statistics aspect of the program, police agencies voluntarily classify, code, and count specific offenses that come to their attention and submit monthly totals to the UCR Section of the Federal Bureau of Investigation (FBI) on forms designed by the Section. In the incident-based effort, police officers use UCR guidelines and instructions to file reports of criminal events using computers with software designed to select and process information on each incident reported. In this new approach, 53 specific data elements for each incident are automatically extracted and submitted to the UCR Section where they are stored and then converted to counts comparable with those submitted under the summary statistics approach.

This development of statistics for publication in *Crime in the United States* using summarized counts of offenses sent by agencies continuing the traditional effort *with* information sent by agencies that adopted the incident-based system ties the two approaches together and justifies calling the older approach the traditional or “old” UCR Program and the newer approach the “new” UCR

Program. A 1980 plan called for the incident-based approach to replace the traditional approach, but at some point during the transition, the UCR Section decided to call the newer approach the National Incident-Based Reporting System (NIBRS). The NIBRS name notwithstanding, the new effort is a basic part of the UCR Program.

Traditional Approach

The traditional UCR Program is more than 80 years old. It was designed by a committee of the International Association of Chiefs of Police (IACP) from 1927 to 1929 and run by the Association in 1930 when the U.S. Congress authorized the Bureau of Investigation of the Department of Justice (now the FBI) to administer the program. The plan, according to the IACP, was to develop a set of uniform descriptions of a small set of crimes and ask local police departments to submit counts of these offenses to the national program.

A basic part of the traditional effort as it operates today is the tabulation of offenses known to the police. These counts were originally limited to seven offenses on the premise that totaling them would provide an indication of the level of crime in a specific place. This “Crime Index” was later broken into a property crime measure, created by totaling burglaries, larcenies, and motor vehicle thefts, and a violent crime measure created by totaling reports of murder, rape, robbery, and aggravated assault. In 1979, arson was added to the set, but it has not been as consistently reported as the original seven offenses.

A 1957 redesign of the UCR Program included a change in the procedure for counting larcenies so that only the theft of things worth \$50 or more were included in the crime index. At the same time, the program started using current population estimates to compute crime rates for the places for which police agencies were responsible rather than the most recent decennial census counts. However, a hierarchy rule was retained under which only a single offense is counted when more than one type of offense occurs during the same criminal event. The traditional aspect of the program continues to use current population estimates and the hierarchy rule, but since 1973, there has not been a minimum property value for a larceny to be counted.

Traditional UCR Program reports of offenses known to the police are essentially victimization measures because one offense is counted for each victim of murder, rape, and aggravated assault. However, the offense known aspect of the program does not provide information about victims. Nor do reports of offenses known to the police provide an indication of the number of offenders involved or information on the characteristics of offenders. In this traditional UCR Program approach, offender information is collected as arrest counts on a separate set of forms designed to provide the number of arrests made by the age, race, and sex of those arrested. The design of the form limits information on race and age to the number of juveniles and adults arrested by race, but arrests by sex show the sex of those arrested by age. The traditional UCR Program approach to arrest information has changed slightly over time. Before 1952, arrest counts were based on the requests of police agencies for fingerprint identification of people arrested and fingerprinted, but after 1951, agencies were asked to submit annual summaries of persons arrested for 40 different offenses. The forms for arrests of juveniles have three additional offenses. Arrest counts changed again in 1973 when agencies were asked to submit monthly arrest reports rather than annual counts.

The basic strength of the traditional UCR Program effort is its national scope and its provision of national and local crime counts and rates. Basic limitations of the old approach are its focus on eight offenses, its use of a hierarchy rule, and its inability to report multiple offenses and multiple offenders. A minor limitation is the reliance on

arrest information to describe offender characteristics. In the incident-based program, offender information is provided by victims and witnesses even if no arrest is made.

New Approach

NIBRS, the new incident-based reporting approach, brought major changes to victim and offender counts. In the new approach, there is no hierarchy rule because the system permits police agencies to report multiple offenses, multiple victims, and multiple offenders in each incident. Reports are submitted on 22 different offenses, with 24 subcategories among them. There are ten major property crimes, five major violent crimes, and five crimes against society. "Crimes against society" is the term used in NIBRS to refer to offenses such as drug use, weapons law violations, gambling, prostitution, and pornography. Although arrest counts for these offenses are available in the old UCR Program effort, none of these counts are available as offenses known to the police in the traditional UCR Program approach.

NIBRS eliminates the need for local agencies to classify and summarize crimes coming to their attention every month. Instead, specially designed software collects information being keyed into computers as police officers report on the incidents to which they have been assigned. The primary purpose of the computer-generated reports is to create permanent records and to help in the operation of the department, but in the process, computer programs collect and organize the incident information in a uniform format that is ready for transmission to a state UCR Program. From there the information is sent to the national UCR Program. In some cases, the information may be sent directly to the national UCR Program.

In this new approach, eight different kinds of larceny are counted, from picking pockets to motor vehicle theft. Four subcategories of sexual assault are counted: rape, forcible sodomy, sexual assault with an object, and forcible fondling. In addition to simple and aggravated assault, the assault category includes intimidation. In addition to the 22 "Group A" offenses, NIBRS collects data on 11 "Group B" offenses if an arrest is made for one of them. The Group B records provide arrest information, including the age, race,

sex, and residence of those arrested, for offenses such as writing bad checks, disorderly conduct, runaway, drunkenness, and trespassing, but Group B segments cannot be linked to Group A incidents, so no victim information is available.

The first guidelines for a new UCR Program were published in 1980 as a blueprint for a new UCR Program. The document did not have a noticeable, immediate impact on the UCR Program, but by 1995, a large enough set of agencies were participating in the NIBRS effort to warrant release of some incident-based data. Nevertheless, the primary use of the NIBRS data is its conversion to the older UCR Program format and its inclusion in *Crime in the United States*. A volume with this name was published in roughly the same format every year since 1960. It contained counts and rates of offenses known to the police for the country as a whole, for states, for metropolitan statistical areas, and for places with populations of 10,000 or more. Clearance rates, national arrest statistics, and statistics on law enforcement personnel were regular parts of these annual volumes. After 2005, the UCR Section stopped publishing the print version of *Crime in the United States* and now presents the annual report on the FBI Web site.

However, much of the additional information collected in the new UCR Program effort is lost when the NIBRS reports are converted to a traditional UCR Program format. However, the additional information has been used for special reports such as "Bank Robberies in the United States," and the UCR Section provides the NIBRS information to criminologists and others for independent analysis. For examples of some uses of NIBRS data in this way, see the special 1999 issue of the *Journal of Quantitative Criminology* edited by Michael Maxfield and Michael Maltz and the special 2007 issue of *Justice Research and Policy* edited by Donald Faggiani. More importantly, the UCR Section has archived NIBRS data going back to 1995 at the Inter-University Consortium for Political and Social Research (ICPSR) of the University of Michigan. A brief look at some of the 2006 NIBRS information collected and archived at ICPSR reveals some of the strengths and weaknesses of the NIBRS approach.

Of about 17,000 police agencies voluntarily providing crime counts to the UCR Program in 2006, only 28% of them sent data in NIBRS format. This

is a basic limitation of the program. These NIBRS agencies provide law enforcement services for 25% to 30% of the U.S. population, but the extent to which the numbers they submit are representative of crime in the United States is unknown. However, a 2007 study comparing the descriptive statistics on Black and White unemployment, female-headed households, per capita income, and public assistance payments for a set of NIBRS cities *with* the descriptive statistics for the remaining non-NIBRS cities found that the mean values for these variables were very close. Except for the variables "population size" and "region," one might think the NIBRS cities were an accidental random sample of all cities with police departments, populations more than 25,000, and at least 1,000 Black residents.

From 1995 to 2006, there was a steady increase in the number of states and agencies shifting to the new approach, and during this period, there was a general expectation that this percentage would continue to increase until the UCR Program had been completely converted from a summary statistics program to an incident-based program. The pace, however, has been very slow, and it now seems that the reluctance of many large city departments to submit NIBRS data may mean that the UCR Program will continue its dual operation indefinitely. Thousands of small and mid-sized departments will probably continue to use NIBRS, whereas most really large cities will probably continue to use their own incident-based systems to send summary counts to the UCR Program.

One objection to the new approach may be uncertainty about the impact of the new UCR Program on local crime rates. Some mayors and police chiefs may think the conversion to NIBRS would create an appearance of rising crime rates. Advocates of the new approach concur that it would, but they assert that in most cases, it would probably be a one-time increase of about 8%. Other large city chiefs may think that releasing data in NIBRS format provides too much information about their department's operation to people outside the agency. Whatever the reason, there has been consistent resistance to participation for more than a decade.

Even with this limitation, one advantage of the new UCR Program is the amount of information on victims and offenders that is available for independent analysis. In 2006, 4,841 agencies provided information on 4.9 million incidents with

5.4 million offenses. For these offenses, participating agencies submitted information on 5.4 million victims and 5.6 million offenders. Because 11% of the offenses reported were crimes against society, where victim information is inapplicable, and because sometimes the victims were businesses or other organizations, victim characteristics were reported for only 4.2 million individual victims. Because many crimes are unobserved, offender characteristics were reported for only 3.9 million individual offenders. Nevertheless, the size of these figures attest to the utility of the new UCR Program, and the results of several studies of NIBRS data suggest that a complete conversion could improve our understanding of crime in the United States.

Another development that some researchers believe could have great impact on attempts to measure crime is a fairly simple extension of the NIBRS program. It entails requiring the inclusion of street addresses in the NIBRS records, so the NIBRS records could be used to create computerized maps showing the local geographical distribution of specific offenses, offenders, and victims. According to proponents, this convergence of an improved UCR Program effort with computerized mapping technology would not produce a new crime measure, but it would provide an informative and useful way to organize and view the information.

Some researchers and crime prevention professionals believe that other computer technology could expand and improve the UCR Program through the statistical use of computerized criminal history files. Neither the new nor the old UCR Program efforts links a current criminal charge brought against an individual to that person's prior arrests and prosecutions. However, increased use of automatic fingerprint techniques and automated records of arrests and prosecution will make it possible to examine patterns of prior contact with the system of justice. Such a program could provide measures of the type and frequency of earlier charges brought against suspects at different points in their lives. It could provide indications of the existence or absence of patterns of involvement in specific types of crime. It could also indicate the extent to which offenders specialize or engage in a variety of types of crime and permit extensive indications of the extent to which individuals persist or desist in criminal activities over the life course. Opponents cite privacy issues as concerns, but advocates argue that it is not be an insurmountable

problem to conceal the identity of those in the file. The Bureau of the Census creates public use files without providing identifying information, and the incident numbers of archived NIBRS incidents are replaced with random characters in a way that retains the incident number as a unique identifier without providing a link to any specific incident.

Despite the apparent advantages of the new UCR Program and the possible advantages of newer technologies, the history of programs designed to measure crime in the past suggests that new approaches to this effort will likely encounter resistance of some kind. Although thousands of police departments in small and medium-sized cities have abandoned the summary statistics approach to crime reporting in favor of the new incident-based approach, the new approach has not been universally accepted. If the 80-year history of the UCR Program is an indication of how long it takes to develop reasonably dependable crime statistics, the dual character of the UCR Program will continue for decades.

V

VANDALISM

Vandalism is the willful or malicious destruction, injury, disfigurement, or defacement of any public or private property, real or personal, without the consent of the owner or person who has custody or control. It includes the cutting, tearing, breaking, marking, painting, drawing, or any other means of destruction against property. Vandalism is a general term that may not actually appear in many state statutes. Instead, statutes may employ terms such as criminal mischief or malicious mischief. Generally, the attempt to commit vandalism is considered a crime, as is supplying the materials that may be used in the actual crime (e.g., aerosol cans for graffiti). The charge of vandalism may be either a misdemeanor or a felony, depending on the dollar amount of the damage inflicted.

Incidence and Trends

According to the Federal Bureau of Investigation's Uniform Crime Reporting Program, 291,575 persons were arrested for vandalism in the United States in 2007. Household surveys show that annually nearly 5 million American households experienced at least one incident of vandalism. Official statistics reveal that vandalism arrests declined sharply in the mid-1990s through 2001, when the number of arrests began to climb. However, fewer persons were arrested for vandalism in 2007 than a decade ago.

Offenders and Targets

The typical offender arrested for vandalism is a White male older than 18 years of age. Contrary to public opinion, most arrests for vandalism are committed by adults. Only one third of all vandalism arrests involve persons younger than 18 years of age. Males are more likely to be arrested for the offense, representing more than 80% of all vandalism arrests. More than 75% of arrests involve Whites; less than one quarter of vandalism arrests involve Blacks or other races.

Patterns of Vandalism

Most vandalism occurs in the late evening hours. Particularly vulnerable are those businesses or properties that have little or no surveillance. Vandalism during after-school hours is also common, particularly for youths. The most frequent targets of vandalism are those located in public spaces, without surveillance personnel or devices, or those on private properties that are open to public view. Less-guarded properties, where no one has direct responsibility for the area, or those properties that are *perceived* as less guarded by potential vandals, are also frequent targets of vandalism or graffiti. As any urban resident knows, vandalism is common on trains, buses, bus shelters or stations, traffic signs, sides of freeways, park benches, billboards, vacant buildings, schools, or other large, plain, light-colored surfaces. Vandalism is becoming common even in graveyards, public libraries, and art museums. Because of the sensitivity and expense associated with these targets, many jurisdictions have

passed new laws providing increased penalties for acts specifically targeting these properties.

Vandalism includes graffiti, trash dumping, light smashing, removing/bending signage or ornamentation, breaking windows, or other defacing of property. Suburban areas are not immune, although the type of vandalism often differs. Suburbanites may have their lawns salted, trees or bushes whacked down, their door locks filled with glue, tires slashed, cars “keyed,” and their property spray painted with graffiti. Of course, graffiti is a pervasive type of vandalism experienced by not only homeowners but also retailers and commercial property owners. Graffiti vandals use a variety of instruments to tag or mark property that include spray paint, broad-tipped felt markers, or shoe polish bottles.

Motivations for Vandalism

The motivation for vandalism is often difficult to understand. To the public, vandalism is viewed as nothing more than mean-spirited acts committed by young sociopaths with too much time on their hands. Those who have studied vandalism and vandals, however, reveal to us a variety of inducements to property destruction. Stanley Cohen has identified at least six specific motivations for vandalism, as follows:

- *Acquisitive*: property destruction to acquire money or property, for example, breaking open newspaper stands or vending machines
- *Tactical*: as a means to another end, such as breaking a window to be arrested and get a bed in prison
- *Ideological*: carried out to promote an explicit ideological cause or to deliver a message, for example, chalking slogans on walls
- *Vindictive*: damage to property to obtain revenge, for example, breaking school windows to settle a grudge against the principal or teacher
- *Play*: damage that occurs because it is part of a game, such as determining who can break the most windows on a house
- *Malicious*: an expression of rage or frustration, often directed at symbolic middle-class property

Preventing and Controlling Vandalism

As well imagined, a raft of indicatives and programs has been designed to eradicate or at least

control vandalism. Significant resources have been devoted to public education. It is hoped that through education, potential vandals, who are assumed to commit these acts without thinking of the damage done or legal consequences of apprehension, might alternatively use a legal outlet to express their anger, alienation, or boredom. Also employed have been programs that involve the wider community, building neighborhood pride and giving residents more reason to watch and protect their communities. More effective are strategies that incorporate property designs that inhibit vandalism, which are often referred to as “target hardening.” Stepped-up law enforcement and increased criminal penalties have also been used, apparently successfully in some cities. During the 1990s, New York City mayor declared “war” on vandalism, making it a centerpiece of his campaign to crack down on those “quality of life” offenses believed to be at the root of major crime problems. In fact, New York crime statistics did show a significant decrease in crime during the decade.

VICARIOUS VICTIMIZATION

Vicarious victimization is a phenomenon through which people experience trauma invoked by the victimization of another person or persons. It can occur in the context of awareness of almost any traumatic event, from criminal victimization to acts of terrorism or war. From a psychological perspective, a person who suffers from vicarious

victimization experiences the emotional reactions of victims or survivors, and those reactions can be greater if the person has experienced first-hand victimization in the past. In the case of caregivers who have experienced a history of direct victimization, psychologists refer to vicarious victimization as *countertransference*. In a more general sense, vicarious victimization can occur more subtly as a heightened state of fear and anxiety. This emotional state is most often associated with exposure to media coverage of criminal events, efforts to invoke fear and anxiety on the part of profiteers, or having more personal exposure to someone else's victimization, as in the case of family members, friends, and even members of the community in which a trauma occurs.

The existence of this psychological reaction was first discovered and studied by therapists working with Holocaust survivors and their children, who also identified many psychological themes common to vicarious victimization. These themes include bystander's guilt, rage, dread and horror, grief and mourning, viewing the victim as a liberator, privileged voyeurism, defensive reactions, viewing survivors as heroes, a sense of bonding with the victim, shame, and other related emotions. Additionally, these therapists discovered that it is not uncommon for people experiencing vicarious victimization to suffer symptoms of posttraumatic stress disorder (PTSD), depression, anxiety, and a decrease in quality of life that is difficult to differentiate from the experience of persons who were directly victimized. People who respond to the needs of victims, such as law enforcement officers, emergency medical personnel, and mental health professionals, are at far greater risk for vicarious victimization than the general population.

Vicarious victimization is more likely to occur when certain contributing factors are present. First, when a recent traumatic experience has occurred in the life of the person coming in contact with or becoming aware of instances of direct victimization, the negative vicarious reaction is more powerful. This temporal aspect greatly heightens the reaction in a person suffering through vicarious victimization because their own experience is fresher. Second, the more similar that previous trauma is to the current trauma a person is witnessing, the more intense the vicarious response. Third, physical and/or emotional fatigue enhances

the likelihood that one will experience vicarious victimization. Finally, the similarities between those experiencing direct victimization and those experiencing vicarious victimization amplify both the reaction and the likelihood of a reaction because of the ease with which the vicarious victim can relate to the suffering and experience of the person directly victimized.

A more generalized form of vicarious victimization can be experienced through witnessing traumatic situations firsthand or through media reporting. Not surprisingly, the closer the connection to a victim, the stronger the vicarious reaction tends to be. As such, family members and closer intimates of direct victims are more likely to suffer more intense symptoms of vicarious victimization than strangers, and actually witnessing the trauma firsthand similarly intensifies the psychological reaction. Vicarious victimization can even be triggered through witnessing the secondary victimization that can occur when the criminal justice system response to a criminal victimization brings dissatisfaction. This type of vicarious victimization often results in feelings of frustration, helplessness, and anger.

The tendency of the media to "fear monger" for ratings exacerbates a more generalized type of vicarious victimization in the public. The constant barrage of crime stories strike a responsive chord in audiences and are often explicitly designed to express themes that are frightening, such as the idea that anyone might be randomly attacked in a brutal manner. Bad news sells better than good news, and more heinous crimes are bigger attention grabbers. As such, stories with shocking, perverse, or bizarre features are likely to receive more media attention. Although there is a benefit in the media drawing attention to the plight of victims, it also increases the vicarious victimization of the public, which negatively impacts the quality of life of those affected. Some mental health professionals have even found some empirical support for the idea that this pervasive exposure to violent criminal acts is partly responsible for the epidemic of depression and anxiety-related disorders currently observed in the United States.

Another source of vicarious victimization in the media comes from businesses intent on selling security products and services to vulnerable and frightened customers. In this instance, vicarious victimization is used as a marketing ploy to buttress

sales of products such as alarm systems and personal protection devices. The more these companies can create a sense of insecurity and fear in potential customers, the more successful they will be. Many acts of terrorism are explicitly undertaken to create vicarious victims as part of the damage they inflict. The September 11, 2001, attacks on the World Trade Center and Pentagon are an illuminating example of the widespread psychological impact of vicarious victimization that can result from terrorism. Panic and feelings of powerlessness, rage, and fear in the wake of the attacks were commonplace, as the seemingly senseless and shocking event claimed innumerable vicarious victims along with those actually injured and killed. The so-called D.C. snipers had a similarly disproportionate psychological impact in creating an atmosphere ripe for widespread vicarious victimization.

Most of the research on more direct forms of vicarious victimization has focused on family members surviving homicide victims and intimate partners of sexual assault victims. Ann Burgess coined the term *homicide trauma syndrome* for the specific type of vicarious victimization that occurs in losing a loved one to homicide, and a plethora of research has since supported her findings that survivors experienced fear, anger, and vengeance that differed markedly from normal bereavement patterns. Many of these individuals meet the diagnostic criteria for PTSD. Interestingly, extensive contact with the criminal justice system has consistently emerged as an impediment to the normal grieving processes in those who experience vicarious victimization.

In the case of intimate partners of sexual assault victims, the impact of the victimization on the relationship and the psychological functioning of the intimate partners have received the most academic attention. Studies show that vicarious victims of sexual assault tend to experience feelings of powerlessness, vulnerability, anger, guilt, and a lowered sense of self-esteem and self-worth. Diagnoses of PTSD are also common in vicarious victims of sexual assault, and these diagnoses are correlated strongly with the direct victims' experience of PTSD. Furthermore, the vicarious victimization of the partner likely interferes with the recovery of the primary victim, as the feelings of the partner make it difficult to provide the emotional support that plays a role in alleviating the victim's emotional distress.

Health care professionals are increasingly addressing the needs of those who experience vicarious victimization and have called for caregivers to deal with this additional type of trauma in themselves, as well as the public they serve. In recent years, awareness of vicarious victimization has increased, which results in more supportive reactions to traumatic events, such as offering counseling in the wake of school shootings, terrorist attacks, and other types of victimization that are likely to result in vicarious responses.

VICTIM ASSISTANCE BY FAITH-BASED ORGANIZATIONS

Faith-based crime victim assistance programs did not come into existence until 1982 when President Reagan's Task Force on Victims of Crime released its Final Report, which encouraged faith-based

organizations to begin supporting victims of crime and victimizers. In 1998, the publication of *New Directions From the Field: Victim's Rights and Services for the 21st Century* revised the original document and suggested that whenever possible, faith-based organizations should provide assistance to victims and victimizers. It was recognized that communities of faith have offered and can continue to offer support to crime victims and that often, victims of crime will seek out support and guidance from religious leaders in the aftermath of crime. The report also offered nine recommendations that would bring faith-based organizations and crime victim service agencies together.

The recommendations were developed with the aim of the faith-based community recognizing that the victim and the victimizer are in need of aid, comfort, and spiritual ministry, and faith-based congregations and organization should provide assistance to victims and victimizers whenever possible. The recommendations consist of the following: Educational institutions that teach clergy and theological seminarians should include counseling courses that teach pastoral staff skills to counsel people who have been victims and victimizers. Continuing education should be provided for all individuals from clergy, police, hospital workers, and others who work within the faith communities and with victims to ensure that they are aware of how they can work together to help victims. All religious institutions should work together with community assistance agencies and organizations to offer joint services and to ensure that victims are aware of all services that are available to them. The education of clergy, victim assistance providers, criminal justice officials, and victim assistance administrators should consist of in-depth instruction regarding the role they can play in assisting victims. Clergy should be required to report any suspicions of child abuse. Protecting children should be a principal role of the clergy, and reporting any suspicions of abuse should override any confidential communications. Policies and procedures should be developed to report any clergy misconduct and should be referred to law enforcement agencies. Religious and spiritual leaders should openly discuss issues of victimization and crime and educate their congregations regarding the pressing issues in their communities. Although these recommendations recognized the role faith-based

organizations should play in assisting the community, in 2001, President George W. Bush established the White House Office of Faith-Based and Community Initiatives to strengthen the role of faith-based organizations in assisting their communities with various social problems. President Bush's program was established with the goal that faith-based programs should be allowed to compete for public dollars to provide public services to their communities on equal footing. The program does not offer funding for faith-based programs but offers technical support by helping faith-based organizations in applying for federal funding from the seven cabinet departments—the United States Departments of Justice, Agriculture, Labor, Health and Human Services, Housing and Urban Development, and Education, as well as the Agency for International Development—or funding opportunities from state-based programs.

Examples of Programs

Since 2001, the Office for Victims of Crimes through the Office of Justice Programs has funded many faith-based organizations in developing victim advocacy programs. One such program is the Interdenominational Ministers Fellowship Peniel Initiative that operates in Nashville, Tennessee. This program is a collaboration between service providers and faith-based organizations that work together to assist victims of crime who live in areas deemed high crime. The program is designed to make crime victims aware of the variety of services available, establish a link between faith-based organizations and victim assistance programs, and educate victim services providers of the spiritual needs of crime victims. The program operates with a staff of three individuals who plan and execute activities that help to develop the coalition between faith-based organizations and service providers to ensure that the target communities will have the care needed when facing a crime.

The STAND! Against Domestic Violence program out of Richmond, California, was developed to address the relationship between the faith-based community and victim services in the diverse community of Richmond, California. The goal of the program is to provide faith-sensitive crime victim services to victims of crime. STAND has developed strong partnerships with community service providers from various

organizations. The focus of this program is to work with agencies that focus on the underserved Latino and Asian populations and the leaders of various faith-based organizations.

Tundra Women's Coalition (TWC) located in Bethel, Alaska, provides services to victims of crimes through various programs such as emergency shelter, child advocacy, legal advocacy, and transitional housing. It also provides support, training, and technical assistance to faith-based organizations, spiritual leaders, and traditional healers to enhance their ability to provide counseling to crime victims. TWC has also conducted conferences to bring together people from the various faith and community support services to provide tools on how the two groups can work together to provide services to victims of crime.

Communities Against Senior Exploitation (CASE) located in Denver, Colorado, is an elder fraud prevention program in which prosecutors and law enforcement officials partner with faith-based communities to provide the elderly with educational information regarding fraud prevention, crime detection and reporting, and victim support. Working with faith-based organizations allows police and prosecutors the ability to reach large numbers of elderly in an environment that promotes hope and empowerment.

VICTIM ASSISTANCE PROGRAMS, INTERNATIONAL

The emergence of victims' rights as an important issue internationally made the materialization of victim-service programs imminent in many regions of the world. During the last 3 to 4 decades, a global proliferation of services has occurred. This entry explores the history of these organizations, examines the different types of international victim services programs, and offers an explanation for the need for international victim services.

Since the earliest recordings of legal procedures, victims of crimes have had opportunities to address the wrongs inflicted on them. Formal and informal processes have existed in various parts of the world that have allowed victims the right to redress wrongs and provide remedies for the settlement of claims. These processes have always been available in a sporadic manner and have been accessible to some and not others, depending on regions, demographics, geography, governments, and structures of communities. In other words, some had more access to victim remedies than others. When retributivism became the dominant theory for punishment in the 1700s in Europe, the rights of the victim began to dissipate.

It was in the 20th century that the importance of and need for a formal institution for addressing international victim rights became evident. After the atrocities of World War I and especially World War II, the international community found it necessary to create legal documents that would bind countries to protect their residents. In turn, international entities, such as the International Criminal Court, were created to address the human rights of global citizens. International documents, like the *United Nations Declaration of Basic Principles for Victims of Crime and Abuse of Power*, the *United Nations Basic Principles and Guidelines on the Right to Remedy and Reparation for Victims of Gross Violations of International Human Rights*

Law, and the *Serious Violations of International Humanitarian Law*, were formulated for the purpose of establishing statutes that would set up formal structures that were meant to provide assistance to victims of crimes in various manners, as well as define the legal pursuit of individual responsibility and accountability for criminal acts.

Although informal, grassroots victim services have existed and continue to exist in vast regions of the world; formal international victim programs did not truly originate until recently. Some international organizations and national entities have created their own bodies of victim programs to assist victims in different jurisdictions and after varying types of crimes. A few of the organizations that were created include the International Criminal Court, the Victim Trust Fund, the European Convention on the Protection of Human Rights, and the Fundamental Freedoms. These organizations handle different aspects of needs that arose from the fundamental finding that public and private entities could be engaged in mass victimizations that required the attention of international organizations to address victim needs. These and other such organizations handle monetary compensation for victim losses during and after a crime, legal redress for victims, and health care assistance for physical, emotional, and mental trauma and guidance for reintegration into society for victims of severe violence.

The different needs that develop as a result of international crimes make the types of offered services vary extensively. Because it is difficult to cover all types of crimes, international conventions have set up funding for independent organizations around the world to provide the necessary care and assistance needed in particular areas. For example, assistance programs are established for mine victims in Burundi, Angola, and Sudan. In other areas of the world, assistance programs are needed for victims of attempted genocide and their families as well as victims of rape camps, death camps, torture, violence against women, human trafficking, and other such internationally recognized crimes. Programs for victims are funded by the larger organizations, like the United Nations, to help their sometimes region-specific victims.

Some international research studies have brought to light the availability of victim assistance around the world and the need for such assistance. The

International Crime Victimization Survey, for example, points out that most of the victim assistance received goes to victims of contact crimes, such as assaults, sexual incidences, and robbery. Of those victims who did not receive victim assistance, more than 40% would have liked such assistance. Overall, the supply of victim services falls short of the demand, especially in developing countries.

As a result of the varying types of crimes and locations of these crimes, there is no uniform source for victim services in the world, which means that most international, national, local, and community agencies work within their own sets of principles, statutes, missions, and goals. Similarly, there is no comprehensive list of victim services around the world as there are hundreds of thousands of such services, both formal and informal (grassroots). The plurality of services and jurisdictions makes it impossible to compile information on all the services available today for global victims of crimes.

Although there are some problems with establishing jurisdiction over some crimes and there are disputes about international law and victim compensation, international victim assistance is needed across the globe. As a result of the improvements in communications, transportation, technology, and weapons, the reach of criminal behavior has made it imperative to provide a transnational body of victim assistance that can help survivors of crimes. Funding from international, regional, and national organizations has made possible an outreach network of victim assistance programs around the world that assist victims in different capacities. Both formal and informal programs continue to flourish today in an attempt to solidify the net of assistance that is needed for the growing number of international victims.

VICTIM ASSISTANCE PROGRAMS, UNITED STATES

Victim assistance programs are organizations that assist crime victims in understanding their rights and navigating their experiences within the criminal justice system. This entry gives an overview of services provided by victim assistance programs, provides the need for and historical involvement of victim assistance programs, and ends with a brief comment about the importance of victim assistance programs.

Background

Because crimes in the United States are viewed as crimes against the state instead of crimes against individual victims, the criminal justice system is structured such that the victim's role is peripheral. Police, prosecutors, and judges focus on solving the crime and apprehending and punishing the offenders. Traditionally, laws and criminal justice processes have been set up to protect the rights of the accused. Victims have only been viewed as part of the process because they are witnesses. In the past, victims and their families were not informed about crime investigations, prosecutorial decisions, court hearings and trials, case outcomes, and the release of individuals who had committed crimes against them. In addition, victims traditionally were not included in any decisions about prosecuting the accused and/or punishments for those found guilty of crimes.

Research indicated that often victims, with little to no knowledge about their cases, were sometimes traumatized as much, if not more, by the criminal justice process than they were by the original crimes against them. Survivors and their

families often experienced feelings of powerlessness. Many survivors of crime have been frustrated by their lack of rights especially in comparison with the seemingly better treatment provided by the criminal justice system to offenders whose rights are protected by constitutional law.

Services

Victim assistance programs were instituted to provide a better experience for crime victims and witnesses than they had traditionally experienced in the criminal justice system. Although independent victim assistance programs exist, most victim assistance programs are government organizations run through the local or state district attorney's office. In addition, the Federal Bureau of Investigation has its own Office for Victim Assistance, which helps victims of federal crimes.

Victim assistance programs work mostly with victims of violent crimes to inform them of their rights and keep them updated about the status of the criminal case in which they were victimized. Victim assistance programs help give the victim a voice. Victims may be given a say or asked their opinions regarding the case in some jurisdictions, especially when the programs are part of the district attorney's office. At the very least, some of the powerlessness experienced by victims is reduced by having someone in the system who is their advocate and who keeps them informed of the criminal case. It is usually also the responsibility of victim assistance workers to inform victims about compensation programs and counseling that may be available to them. Finally, victim assistance workers may attend trials and other court proceedings with victims and/or their families, explaining the proceedings and providing emotional support.

History

In 1972, Carol Vittert established the first victim assistance program in the United States. After witnessing an assault in St. Louis, Missouri, Vittert took the victim home and helped her. Vittert, realizing victims of crime needed support, established Aid for Victims of Crime, Inc. The police would provide Vittert with a list of victims whom she and her friends would visit and offer support. The first government victim assistance programs were established

in 1974 in district attorneys' offices in Milwaukee and Brooklyn with funds from a federal agency called the Law Enforcement Assistance Administration, which was established to study and fund crime prevention efforts.

Growing out of a national victims' rights movement and increasing concern for victims' rights, groups such as the National Organization for Victim Assistance, Parents of Murdered Children, and Mothers Against Drunk Driving were established during the 1970s. These organizations worked to ensure that the criminal justice system would pay attention to victims during criminal proceedings. In 1982, President Ronald Reagan appointed the Task Force on Victims of Crime. The Task Force made 68 recommendations leading to passage of the Victims of Crime Act, which provided funding for victim assistance programs.

Importance

While victims of crimes, especially violent crimes, still experience feelings of frustration and powerlessness in the criminal justice process, victim assistance programs have made the experience of navigating the criminal justice system, and especially court proceedings, less daunting and mysterious than they were in the past. Victim assistance programs provide survivors and their families with valuable information and support and they help make sure that, when legally viable, victims have a say in prosecutorial decisions and court proceedings.

VICTIM BLAMING

Victim blaming refers to the perception that victims are culpable or responsible for their own fates. Attributions of responsibility typically focus on an action or behavior of the victim that increases the risk of victimization. Victim blaming is a general term that incorporates various levels of responsibility shared by and blame attributed to victims. Although the term is applicable to victims of various events, which include accidents and natural disasters, it is especially relevant in light of the criminal justice system's increased focus on the plight of victims in recent decades. This entry briefly introduces victim blaming research as it relates to crime victims and discusses two theoretical approaches to blaming. The entry concludes with a discussion of the consequences of victim blaming for the criminal justice system.

Degrees of Blaming

Attribution of blame to victims of crime is an idea as old as victimology. Benjamin Mendelsohn, who is considered the father of victimology, recognized that victims could be perceived as completely innocent, partially blamed, or fully blamed for their experiences. Blaming may occur in instances in which there is clear indication of victim provocation; for example, the victim provoked a fight that results in their injury. Criminal victimization, in these instances, is characterized as reciprocal if both parties engage in criminal behavior. Although

the level of blame may vary across parties, both parties are perceived as somewhat responsible. Blaming may also occur in situations in which there is unintentional precipitation by the victim through carelessness, helplessness, negligence, or poor judgment. Many individuals may be responsible for perpetuating perceptions of victims as responsible for their fates, including members of the criminal justice system, members of society, or criminal offenders. Whether victims should be blamed at all, however, is rather controversial.

Victim Blaming and Sexual Assault

The theory of victim activity as influential in criminal victimization has been addressed in research on homicide and property crime; however, attribution of blame to sexual assault victims has been the subject of most victim blaming research. Some victims of sexual assault are perceived as more culpable than others. The characteristics that may influence blaming in cases of sexual assault include revelations of past sexual conduct by the victims, such as any experiences with prior sexual assault. Victims perceived as dressing or acting seductively or provocatively may also be viewed as more blameworthy in instances of sexual assault.

The use of drugs or alcohol by victims prior to sexual assault incidents also increases victim culpability. Victims who fail to resist their attacker during sexual assault are also perceived as facilitating their attack. Although there are variations on the theory of victim blaming and the victim's role in precipitating crime, two perspectives are discussed here as a framework for understanding the function of victim blaming. They are the just world perspective and defensive attribution.

Just World and Defensive Attribution

Psychologist Melvin J. Lerner postulated a "just world" theory of victim blame, contending that people want to believe that others' fates (both good and bad) are the result of their own actions, and that people deserve these fates. Lerner's research supports his contention that perceptions of a just world are threatened when others receive harm unjustly and that people attempt to compensate and generalize about why undeserved harm

befalls undeserving people. When belief in a just world is threatened, people will use tactics to rationalize the victim's fate; they will demean even an innocent victim rather than accept that the world may not be just. The rationale for this belief is simple as it has implications for the fate of others: If we live in an unjust world, then we can all succumb to fates that we do not deserve, no matter our good nature. Research on the just world hypothesis generally reveals its importance in explanations of general victim attribution, even though its salience in attributing blame to crime victims has only recently been explored. Although the theory is useful in explaining why victim blaming may occur, research addressing how it may affect victim blaming in criminal incidents other than rape is limited.

Kelly Shaver proposed the premise of defensive attribution: People adjust their tendency to blame depending on whether they perceive themselves to be at risk of suffering the same fate. The tendency to blame will be greatest in situations where a victim is dissimilar to us than for victims who are similar to us. There is some support for this theory, as males generally blame female victims of sexual assault more than females do.

The current knowledge about perceptions of rape victim culpability indicates that victim characteristics can influence blaming attitudes. Just world and attribution theories of blaming suggest that blaming may serve as a self-protective mechanism or may result from the inability to identify with victims. Knowledge about victim-blaming attitudes is relatively recent and the consequences of these attitudes for victims of crime are not well understood. The topic merits more attention, specifically regarding the connections between blaming and outcomes for victims, influences on reporting, and treatment of victims by the criminal justice system.

VICTIM COMPENSATION

Criminological research generally focuses on the nature of crime; the enforcement of criminal laws; detection, conviction, and sanctions; and community reaction to criminal actions. Historically, crime victims have been given insufficient support as integral, albeit unwilling, participants in the occurrence of criminal events. Aside from giving factual statements and testifying in criminal cases, crime victims often fail to receive the help they need after the trauma of violence or property crimes.

Nature of Victim Compensation

Crime victims face many problems after they are exposed to violent criminal incidents. Victims are subject to financial stress, physical injuries, and emotional trauma. Dealing with and recovering from injuries that result from physical harm or emotional trauma are extremely difficult. Victims often require help in paying the costs of medical care and counseling, or replacing lost income because of personal disability or the death of a family member.

The role of crime victims within the criminal justice system has been extremely limited. Before the implementation of prescribed federal guidelines in the 1990s, it was uncertain whether victims would receive sufficient support from federal, state, or local agencies. Each state or municipal agency formulated its own standards on victim support. However, this practice has changed dramatically since the early 1960s.

Crime victim compensation is the oldest form of organized victim assistance in the United States.

The first compensation program was created by California in 1965, with nine states operating similar programs by 1972. Most of the money for these programs comes from offenders, as a majority of states fund victim compensation programs entirely through fees and fines charged against those individuals convicted of criminal activity. In fact, federal grants to agencies that administer victim compensation programs provide close to 25% of the money for payments to victims. These funds are also derived from offender fines and assessments.

Victim compensation programs differ from restitution programs. Although funds for both programs are derived from offender fines and assessments, victim restitution programs focus on the direct payment of funds by the offender to the victim of the criminal activity. Thus, a judge can order particular sums sent to the victim through a criminal justice agency or directly to the victim. In some cases, a judge orders that the offender must render symbolic restitution through a series of \$1 checks sent weekly for a stipulated period of time.

Such compensation is exempt from the crime victim programs operated by federal, state, or local criminal justice agencies. Crime compensation programs can support victims for a significant category of miscellaneous needs. The monies are paid from a general fund established through federal grant funds, collected fees, and assessment payments from offenders on probation or parole. Contemporary compensation programs are paying out close to \$265 million annually to more than 115,000 persons.

Eligibility for Compensation Programs

A variety of victims are eligible for compensation funds. The categories include victims of rape, assault, child sexual abuse, drunk driving, domestic abuse, and homicide. Such crimes impose an undue hardship on victims through physical, emotional, or physical harm. According to the National Association of Crime Victim Compensation Boards, close to a third of the recipients who receive compensation are children. Most of those children are victims of sexual abuse.

Compensation programs cover a wide variety of expenses and losses related to criminal injury and homicide. In addition to offering assistance with medical care, mental health treatment, funerals,

and lost wages, many programs include crime scene cleanup, travel costs to receive treatment, moving expenses, and the cost of housekeeping and child care.

Compensation programs are largely supported by federal grants. To receive 25% or more of their annual funding from federal sources, programs must cover medical expenses, mental health counseling, and lost wages for victims, in addition to funeral expenses and loss support for families of homicide victims. Drunk driving and domestic abuse must be considered as compensable crimes. Domestic violence victims cannot be disqualified on the basis of being related to or living with the offender.

In addition, programs must agree to consider for eligibility all U.S. citizens who are victims of crimes within their states, regardless of residency. Each state also must offer benefits to its residents who find themselves victimized in states without compensation programs. Programs must also insure their own residents who are victims of terrorism in foreign countries. In addition, programs must cover crimes that fall under federal jurisdiction within the state. Crimes occurring on Indian reservations, National Park lands, or military bases would fall under this category.

States generally request and analyze police reports to confirm that a crime took place and to determine whether the victim was involved in any illegal or participatory activity when victimized. The source of this information is derived from service providers like hospitals, doctors, counselors, and funeral homes, in addition to employers if work loss is claimed.

Eligibility Requirements

Victim compensation programs are based on federally prescribed requirements. The victim must meet five conditions to obtain benefits. First, the victim must report the crime promptly to law enforcement. The norm is generally 72 hours, but most states have "good cause" exceptions applied to children, incapacitated victims, and other special circumstances.

Second, victims must cooperate with police and prosecutors in the investigation and prosecution of the case. The imposition of this clause is necessary to encourage conscientious reporting to criminal justice authorities. Victims are often reticent in coming forward unless there is an incentive. Economic support

is one such significant justification for reporting their victimization status to the criminal justice system.

Third, victims must submit a timely application to the compensation program. The time limit is generally 1 year from the date of the crime. There is discretion to waive these requirements in specific circumstances. Victims must also provide other information as requested by the program.

Fourth, the victim must have a cost or loss not covered by insurance or some other readily available supporting source. Expenses recovered from other programs or sources cannot be covered by a victim compensation program. For example, compensation obtained from insurance companies or another public benefit program like the Veterans Administration and Medicaid would exempt a claimant for victim compensation benefits.

Fifth, the victim must be innocent of criminal activity or significant misconduct that caused or contributed to the victim's injury or death. This means that victim-precipitated criminal offenses can not be compensated through a state fund.

In addition, the apprehension and/or conviction of a perpetrator is not a prerequisite to receiving compensation. Compensation programs focus primarily on the victim rather than the criminal justice process of litigating the relevant criminal case. Police reports are relied on to make the primary determination.

Finally, the eligibility of a victim's dependents or other secondary victims is dependent on the eligibility of the victim who suffered the injury or death. Federal agency directions cite an example where homicide victims who engage in criminal activity render the family ineligible for any benefits.

Compensable Costs

Five categories of compensable costs are covered in all states. First, medical expenses are considered for victim support. Any uncompensated hospital bills or fees for medical supplies, physicians, or other medical-related services are included in this category. Victims are often insured and must rely on state compensation agencies for support.

Second, victim costs associated with mental health counseling are also included as a compensable cost. Mental health counseling would include fees tendered to psychiatrists, psychologists, or counselors who help victims work through the trauma associated with the criminal event.

Third, victims can be compensated for lost wages associated with an inability to work because of a crime-related injury. Many victims incur physical disabilities that hinder their ability to perform manual labor or work adequately at administrative and related office positions.

Fourth, dependents of homicide victims are also considered victims for the purpose of compensation. Lost support for dependents of homicide victims is allowable when the victim was a major wage earner or contributor to the household income. Individuals covered include spouses, children, and extended family members who live in the same household.

Fifth, support is provided for funeral expenses. This category is important given that the average funeral can cost more than \$5,000. Social security has a limited death benefit of approximately \$255. Family members clearly require assistance in meeting these substantial bills.

In terms of compensation paid, fees to hospitals, doctors, and therapists comprise more than half of the amounts paid. Lost wage and support payments are the next largest category. A number of other costs are also covered. They include the following seven categories.

First, moving or relocation expenses are covered by state compensation agencies. The stipulation is that victims must be in imminent physical danger, or the move must prove medically necessary because of severe emotional trauma from an assailant. Second, transportation to medical providers is included but limited to occasions when the provider is located in a place distant from the victim's residence. Other special circumstances may also apply under this category. Third, replacement services for work the victim cannot perform because of crime-related injury are also considered. Compensation is primarily directed to child care and housekeeping.

Fourth, expenses incurred in crime-scene cleanup, or the cost of securing a home or restoring it to its precrime condition, is included within the category of victim compensation. Cleaning, renovation, and other necessary repairs are incorporated in the provision of these funds. Fifth, rehabilitation is also covered through compensation agencies. Such costs may include physical therapy and/or job therapy. Uncovered medical bills in this category are covered when victims either lack insurance or sufficient insurance where the costs prove a financial hardship. Sixth, agencies cover prescribed modifications to homes or vehicles in

the case of paralyzed victims. Individuals who require modification of kitchen counters, installation of ramps, or other equipment are supported through the state system. Finally, fees for attorneys who help victims apply for compensation are also covered. However, such fees are paid in limited amounts and sometimes for appeals.

Personal property stolen, lost, or damaged during the crime is not covered. Only medically necessary equipment (in the case of eyeglasses or hearing aids) will be compensated. According to federal guidelines, only three states (Hawaii, Rhode Island, and Tennessee) currently pay for pain and suffering.

There are also maximums and limits to compensation payments. Maximum benefits paid from state programs generally range from \$10,000 to \$25,000. Several states have higher maximums. Many states have lower limits on specific compensable expenses like funerals and mental health counseling.

Collateral Resources

Federal guidelines prescribe that compensation programs are "payers of last resort." This means that any other source of payment to the victim must be assessed before the programs will authorize payment. Victims must first apply medical or health insurance, employee benefit programs, social security, and Medicaid.

In the case of restitution, compensation programs usually pay in advance rather than force victims to wait to receive restitution payments. In the event that the victim recovers any money from the offender or any other party liable for the victim's expenses, the compensation program must be paid back for that portion of expenses which the program has covered. The only exception is when the victim's total out-of-pocket losses exceed the amount both paid by the program and recovered from another source.

VICTIM IMPACT STATEMENTS

As the victims' rights movement gained momentum in the 1970s, attention has focused on the passive role of victims in adversarial criminal justice systems. Historically, victims have had no standing in the trial of the violator. They were relegated, at best, to the role of a witness. This caused victims to experience alienation and frustration with the criminal justice system. To address this concern and to integrate victims in proceedings, victim impact statements (VIS) at the sentencing stage have been conceived. The practice of introducing victim impact statements in the sentencing phase of criminal cases is relatively new, but it has already become widely implemented in countries with adversarial legal systems. The specific practices surrounding victim impact statements vary by jurisdiction. Although there is widespread support for the therapeutic usefulness of these statements, and some evidence indicates that they are useful for court actors, their practice is not without controversy. Concerns have developed particularly surrounding whether victim impact statements violate offender rights and their place in adversarial systems.

Definition

Victim impact statements, or victim personal statements as they are referred to in the United Kingdom, are composed by individuals who have been personally harmed by a criminal offense. Individuals who submit such statements may have

suffered direct victimization, or they may have been indirectly impacted by a crime, such as through the death of a loved one. These statements are submitted to the court for consideration at the time of sentencing.

Victim impact statements focus on describing the harm suffered by the individual. The VIS may include details of the physical, emotional, psychological, social, or financial detriments resulting from the criminal offense. In some jurisdictions, these statements may also include the victim's opinion about the appropriate sentence for the offender (victim statement of opinion, but the latter is not practiced in countries outside the United States nor within all jurisdictions in the United States.

History

The first victim impact statement was created in Fresno, California, in 1976. Controversy has surrounded victim impact statements since their inception, particularly in the context of capital penalty. Two Supreme Court cases—*Booth v. Maryland* (1987) and *South Carolina v. Gathers* (1989)—had initially ruled the consideration of victim details in the sentencing of capital cases as unconstitutional. The subsequent case of *Payne v. Tennessee* (1991) represented a reversal of the Court's original stance, and all 50 states now make some use of victim impact statements, as do other countries including Australia, Canada, England and Wales, and Scotland. The adoption of VIS has been part of a broader shift toward an increase in victim participation in court proceedings. Victim rights bills passed in some jurisdictions require courts to allow or consider victim impact statements at sentencing.

Processes

Victim impact statements are collected through varied processes. In some jurisdictions, victims may submit their statements to the court directly, whereas in others they may be mediated through a probation office, the prosecution, or other agency. Controversy exists regarding whether police should educate victims regarding VIS at the time that a crime is first reported. Although this advice would allow victims to keep track of the various costs

more easily that originate as a result of the offense, it may also result in greater disappointment if the offender is not caught and the costs borne by the victim cannot be recouped. Victim impact statements are commonly submitted to the court in writing or presented orally (the right of allocution). In some jurisdictions, the statements may be submitted by videotape.

Benefits

Proponents of victim impact statements suggest that VISs can benefit victims as well as the justice system. They largely focus on the potential expressive value that VISs offer to victims rather than any instrumental role it may have. There is also some evidence that court actors are appreciative of the informational content provided by victims who submit impact statements. Although evidence is mixed regarding whether victim impact statements actually affect sentencing outcomes, proponents hold that this should allay critics' concerns that allowing such statements will lead to harsher sentences for offenders.

Therapeutic Potential for Victims

The use of victim impact statements has been supported first and foremost on the basis of the potential therapeutic effect of allowing victims to voice their experiences and have their harms acknowledged as part of the legal process. This school of thought holds that the opportunity for victims to express what they have suffered, particularly in a court of law, can be beneficial regardless of whether the VIS has an actual influence on the outcome of the sentencing process. When courts refer to victims' impact statements in sentencing remarks and validate victims' harm, victims can experience a sense of recognition by the courts for their suffering, and their satisfaction with justice is increased.

Informational Value to Courts

To the extent that judges or juries endorse the principle that the severity of punishment should match the harm caused by the crime, victim impact statements can provide important information to these decision makers. Some information contained in the VIS may overlap with details already available to the court through other means, such as

police reports or presentence investigation reports. At the same time, VISs provide the victim with an opportunity to make the court aware of any negative effects that may not have been addressed through such other means. Judges have reported that the VISs sometimes provide them with new insight into the severity of a crime. It is not inevitable that exposure to a victim impact statement will cause a judge to view a crime as more severe than previously believed; in some cases, such statements have led judges to recognize the harm caused by the crime as less severe than initially presumed. The additional information about the harm provided by VIS helps in increasing sentence commensurability.

Restorative Justice Values

The restorative justice approach has historically been viewed as largely incompatible with adversarial legal systems. Because restorative justice proceedings require that offenders accept responsibility for their actions, most serious offenses cannot be processed through restorative justice proceedings. The adoption of victim impact statements has been welcomed as one mechanism for integrating restorative justice principles into the adversarial system. The VIS provides opportunity for bringing the victim into the justice process and providing an opportunity for offenders to be exposed to the harm that they have caused to their victims.

Controversies

Critics of victim impact statements highlight several actual or potential problems related to allowing the presentation of VIS at the time of sentencing. These concerns range from the belief that such programs would not be used to an extent that would justify their availability, to the effects of victims providing the statements on their welfare, to the fear that victim impact statements may constitute a violation of offenders' due process rights.

Underutilization

Not all victims who are provided an opportunity to submit a victim impact statement will do so. Some may not find the crime serious enough to warrant the compilation of a statement. Others may be fearful of retaliation by the offender.

Evidence suggests that some victims may be unaware of their option to make a statement or may not understand the purpose of doing so. Some also argue that victims are not interested in providing input into sentencing and are interested only in receiving information about the case or being consulted about the sentence. As such, some hold that there is not enough evidence of a demand for victim impact statements to justify their use. In addition, uneven utilization of victim impact statements may lead to disparate sentencing practices between those cases in which statements are presented and those in which they are not.

Victims' Raised Expectations

Some critics are concerned that the availability of victim impact statements may actually reduce victims' satisfaction with the justice process. This argument holds that whereas victims may experience some therapeutic relief through the communication of the harms that they have experienced, these therapeutic benefits are negated, or even overshadowed, by the disappointment or frustration that victims may feel if they do not perceive that their statement had been taken seriously, or if they do not believe that their statement had a practical impact on the outcome of the sentencing process.

Concerns About Offender Rights

The constitutionality of allowing victim impact statements to be presented during sentencing has been challenged on the grounds of the Eighth Amendment. In the 1987 case of *Booth v. Maryland*, the Supreme Court ruled the use of victim impact statements to be unconstitutional in capital cases. The reasoning behind the Court's decision was that the content of such statements is irrelevant in determining the details of the crime and the background of the defendant, and thus it may create an unfair bias against the defendant by introducing extraneous factors to the sentencing process. The *Booth v. Maryland* ruling was upheld in 1989, when the Supreme Court determined in *South Carolina v. Gathers* that it was unconstitutional to discuss victim characteristics at the time of sentencing in capital cases.

In the 1991 case of *Payne v. Tennessee*, the Court reversed its stance on victim impact statements,

holding that such information did not pose a risk to the constitutional rights of the defendant. Still, the concern about offender rights has not disappeared. Although research has largely demonstrated that victim impact statements have a minimal impact, if any, on sentencing severity, there remains a sense that allowing victims to present in court may unfairly bias the judge against the offender or otherwise violate offenders' fundamental rights.

Impact on Sentencing

One argument against VIS has been that their practice would lead to an increase in sentence harshness. However, no firm research has documented such a trend. Research on aggregate sentence data has largely shown that the introduction of VIS has little, if any, punitive impact on sentencing outcomes. Impact may be discerned in a small number of cases, and it has been as likely to be in the direction of harsher as more lenient sentences. Critics highlight the catch-22 of this situation, however: If victim impact statements do lead to harsher sentences, then they may pose a danger to offenders' rights; if they have little to no impact on sentencing, then they may contribute to victims' disappointment with the justice process. The weak evidence of practical outcomes has led some to question whether an investment of resources to support the availability of victim impact statements is worthwhile. Those who consider the VIS as having merely an expressive function disagree, arguing that the therapeutic function of the VIS is paramount.

Future Research

The opportunity for victims to submit impact statements at the time of sentencing has been noted as one of the most important accomplishments of the victims' rights movement. Many positive outcomes to allowing such statements have been identified, the most prominent being the potential therapeutic effect for the victims. Still, the idea of including victims' input into sentencing is not without controversy, and the implementation of victim impact statements has not been consistent or uniform. Although research has largely indicated that such statements have minimal impact on sentencing outcomes, opponents have lingering concerns about the value added by such statements

and that allowing such statements may interfere with offenders' rights. Subsequent research is needed to provide more definite answers.

victimization. However, a variety of paradigm shifts, scientific advances, and social and political forces since the 1960s and 1970s provided a foundation from which theories of victimization emerged.

For instance, in the latter half of the 20th century, a shift occurred among many scholars toward viewing “crime” as more than just the behavior of an offender. Instead, crime became increasingly viewed as a “system,” involving not only an offender but also a target or victim, as well as a time/place context that supports or facilitates the victimization of the target by the offender.

Alongside this new paradigm, new sources of information about crime emerged, addressing limitations of data compiled from police reports (reported annually in the form of the Uniform Crime Reporting Program). Specifically, the early 1970s marked the emergence of the National Crime Survey (now called the National Crime Victimization Survey), which allows large amounts of information on crime events from the vantage point of victims to be collected and analyzed annually. This national effort set the stage for many subsequent victimization surveys in local communities and/or on special samples (i.e., high school students, college students, women, etc.). These various victimization surveys, in comparison with official police data, allowed researchers to estimate more accurately the incidence and prevalence of crime in society because they measured crime events, whether or not they were reported to police.

Finally, beginning in the 1960s, a sociopolitical movement intended to provide more attention to victims and their rights within the criminal justice system. In response to this movement, more support services began to be provided to victims, and avenues were provided for allowing enhanced involvement on the part of victims in the process of justice (i.e., through victim impact statements).

The confluence of these various sociopolitical and scientific shifts was ideal for the emergence of various theoretical perspectives on victimization. These etiological perspectives focused on a wide range of causal influences, which ranged from routine daily activities and lifestyles, to interpersonal interactional dynamics, to broad-based social inequality. Major theories that emphasize these various influences are described in greater detail throughout the remainder of this entry.

VICTIMIZATION, THEORIES OF

The fields of criminology and criminal justice have focused, historically, on understanding criminal offending in comparison with criminal

Lifestyle-Exposure Theory

In 1978, Michael J. Hindelang, Michael R. Gottfredson, and James Garofalo published their book, *Victims of Personal Crime: An Empirical Foundation for a Theory of Personal Victimization*. This work delineated the sociodemographic correlates of victimization based on an analysis of victimization survey data. They noted that particular subgroups of the U.S. population experienced greater risk of victimization relative to other groups. Specifically, men, younger adults, and African Americans were at an increased risk in comparison with women, older Americans, and Whites, for instance. To account for such trends in victimization risk, Hindelang, Gottfredson, and Garofalo suggested that victimization risk was a function of lifestyle. In particular, men, younger adults, and African Americans tended to have lifestyles—including patterns associated with work, school, chores, leisure, etc.—that exposed them to victimization opportunities. The specific features of lifestyles presumed to create more exposure to crime were said to include time in public (especially at night), time away from family or household members, and proximity to and/or association with high-offending groups. In short, these features of lifestyle shaped the opportunity for individuals to become crime victims.

Routine Activity Theory

While Hindelang, Gottfredson, and Garofalo were publishing *Victims of Personal Crime*, Lawrence E. Cohen and Marcus Felson were working on similar research, resulting in the 1979 publication in the *American Sociological Review* of their seminal article, “Social Change and Crime Rate Trends: A Routine Activity Approach.” Cohen and Felson examined temporal changes in U.S. crime rates from 1947 to 1974. They focused in particular on predatory crimes, which were defined as illegal acts that involved the direct damaging or taking of the person or property of another (p. 589). They highlighted the dramatic increase in predatory crime during that time period, with the most glaring portion of the overall increase occurring during the decade of the 1960s. Cohen and Felson then offered a “routine activity” explanation for this increase.

As a starting point for their theory, Cohen and Felson defined the following three necessary ingredients for crime: (1) a motivated offender, (2) a suitable target, and (3) absence of capable guardianship. For a predatory crime to occur, according to Cohen and Felson, a willing, motivated offender must come into contact with a victim or target that can be overtaken in a time/space context (i.e., a time and a place) that does not provide an adequate level of protection in the form of persons or things that could intervene between offender and victim. The convergence in time and space of a motivated offender, a suitable target, and absence of capable guardianship was said to present an *opportunity* for crime.

Cohen and Felson suggested that the first ingredient for crime—a motivated offender—was a “given.” Rather than understanding crime as a function of variation in offender motivation, Cohen and Felson indicated that we could better understand crime in terms of variation in the other two ingredients for crime. In particular, they suggested that crime had increased so sharply between 1960 and 1970 because of the corresponding, profound changes in societal levels of suitable targets and capable guardianship. In short, Cohen and Felson posited that, between 1960 and 1970, Americans and their households became more suitable and less capably guarded targets. They also suggested that it was the changing routine, daily activities of U.S. residents that created increased opportunity in the form of increased target suitability and diminished guardianship. Particularly opportunistic activities, according to Cohen and Felson, were nonhousehold activities.

Major shifts in the labor force participation of women occurring between 1960 and 1970 were thought to underlie much of the increase in levels of nonhousehold activities. Women’s markedly increasing participation in the labor force had substantial implications for the public exposure of women and the lack of guardianship provided to American households during the daytime. For instance, Cohen and Felson presented data showing that, in 1960, about 30% of households were unoccupied by someone 14 years or older between the hours of 8 a.m. and 3 p.m. By 1971, that figure exceeded 40%. As a result, more and more households lacked capable guardianship, thus providing increased opportunity for a crime such as burglary.

At the same time, women were spending more time outside the house, commuting to and from work, resulting in increased exposure to “street” predatory crime, including robbery.

Beyond work-related activities, Cohen and Felson theorized that routine leisure activities were also changing in the United States between 1960 and 1970 among both men and women. With an increasing percentage of U.S. households consisting of two working adults, more disposable income is available to be spent on leisure pursuits outside the home (i.e., attending sporting events, movies, restaurants, or vacation destinations) and on the purchase of household durable goods (i.e., televisions, stereos, cars, bicycles). This proliferation of public leisure activities and household items (especially valuable but lightweight items) also increased opportunities for crime. From the routine activities theoretical perspective provided by Cohen and Felson, these leisure and consumption patterns simply made it more likely that motivated offenders would encounter suitable targets in time/place contexts that lacked adequate guardianship.

Cohen and Felson tested their theory by examining whether a “household activity ratio” was related to the changing rates of predatory crime in the United States. They measured the household activity ratio as the proportion of U.S. households that were either “non-husband-wife” households or households that could be classified as “married, husband-present, with a female labor-force participant” (1979, p. 600). They hypothesized that increases in such households would be associated with increases in U.S. predatory crime rates under the assumption that such household structures served to approximate routine activities that would increase exposure to motivated offenders, increase target suitability, and decrease guardianship. They found impressive support for this hypothesis across five different predatory crimes.

Routine Activities and Individual Victimization

Following Cohen and Felson’s landmark study, later work extended routine activity theory’s application beyond changing national rates of crime. Subsequent work often applied the theory to variation in individual risk of victimization instead. Leading theorists (e.g., Cohen, Kluegel, and Land) suggested, in particular, that the likelihood that an

individual would experience victimization was a function of that person’s exposure to motivated offenders, proximity to high-crime areas, target attractiveness/suitability, and absence of capable guardianship. From this perspective, individuals whose lifestyle and routine activities make them more visible and accessible to others (possible motivated offenders) are at increased risk for victimization. Similarly, individuals whose lifestyle and activities put them in close physical distance to “risky” areas (i.e., areas where a large proportion of offenders reside or where a large number of targets exist) are at increased risk. Individuals who possess valuable, visible, accessible, and moveable goods are at greater risk for property victimization. In terms of more violent offenses, where victim–offender confrontation is part of the criminal event, individuals who have characteristics that make them physically or socially vulnerable (i.e., small physical size, limited strength, low socioeconomic status, and intoxication) are considered to have heightened victimization risk. Finally, individuals who engage in safety precautions designed to provide protection or defense—including actions such as installation of extra locks, use of security systems/cameras, or participation in neighborhood watch—are presumed to be at reduced overall victimization risk.

Empirical evidence regarding the ability of routine activity theory to explain individual variation in victimization has been impressive. Several decades of research have shown that individual-level indicators of exposure, proximity, target suitability, and guardianship are positively related, as predicted, to a variety of types of individual victimization including, as just a few examples, both property crime and violent “street crimes” (i.e., burglary, theft, physical assault, robbery, and sexual violence), school crime, crime on college campuses, workplace violence, computer fraud, and white-collar crime.

Offending Lifestyle and Individual Victimization

As an offshoot of routine activity theory’s application to understanding individual victimization risk, there has been a special focus on the theoretical role of criminal offending behavior on individual victimization risk. A long-standing recognition among researchers indicates that a substantial overlap exists between victim and offender populations. In other words, many offenders are also

crime victims. Despite recognition of this correlation, research to date has not clearly revealed whether the relationship is causal. There are, in fact, competing theoretical ideas about how offending and victimization might be related. The most popular perspective on the offending-victimization linkage is consistent with routine activity theory. That is, a criminal lifestyle provides opportunity for victimization. A criminal offender is, after all, likely exposed to other offenders and/or often in close proximity to high-crime locations because of his or her own offending activities. Furthermore, a criminal offender often provides target suitability. For instance, a successful drug dealer has a plentiful stock of a valuable commodity as well as a good deal of cash. Both drugs and cash make attractive targets. Other types of offenders are suitable targets because of their vulnerability. For example, a drug user is more easily duped when under the influence of his or her addiction. Additionally, offenders might be viewed as suitable targets in that their offending behavior is provocative, which elicits strong reactions from others to the point of victimization of said offender. Finally, an offender can be thought to have less capable guardianship than nonoffenders in the sense that an offender is less likely to call on law enforcement for protection in fear that his or her own criminal activities are discovered.

Despite theoretical and empirical support for the idea that offending might increase victimization, the causal linkage is far from proven. The idea that the relationship works in reverse is supported both theoretically and empirically—with victimization increasing offending. This sort of relationship is justified on the grounds that victimization is a traumatic event, causing negative reactions—including escape and offending in some who experience it. Another explanation is that victimization causes a withdrawal from prosocial ties and activities, thereby increasing exposure to and involvement with marginalized others, including offenders. Although there is limited empirical support for this idea, somewhat contradictory evidence suggests that victimization leads to a less risky as opposed to a more risky lifestyle.

In short, much debate surrounds whether offending causes victimization or, conversely, whether victimization affects offending and, if the

latter, whether victimization increases or decreases offending. Given this theoretical ambiguity, some have suggested that offending and victimization are reciprocally rather than unidirectionally related. This proposed bidirectionality is understudied as of yet. However, one seminal piece of research in this regard is the work of Janet Lauritsen, Robert Sampson, and John Laub. In their 1991 article published in *Criminology*, Lauritsen, Sampson, and Laub analyzed the first five waves of the National Youth Survey and found that delinquent lifestyle significantly increased victimization, but victimization also significantly increased delinquent lifestyle. Nearly two decades later, this study remains fundamentally important as it represents one of the few studies that addresses reciprocity between offending and victimization.

Low Self-Control and Individual Victimization

Another offshoot of routine activity theory's application to understanding individual victimization risk is theory emphasizing the role of self-control on the part of crime victims. Christopher Schreck, in particular, has been at the forefront of developing a theoretical understanding of how an individual's self-control contributes to victimization risk. His explanation dovetails nicely with routine activity theory, as it relies on the idea that variations in self-control coincide with variations in criminal opportunity. For instance, Schreck suggests that individuals with low self-control are risk takers, thus leading to greater exposure to dangerous people and places. In addition, individuals with low self-control are more likely deemed suitable targets by peers because of their impulsive—sometimes to the point of being noxious—behavior. In short, low self-control can serve to antagonize motivated offenders. Finally, lower self-control suggests limited planning and foresight, implying that capable guardianship might be more often lacking among individuals with such a trait.

Routine Activities and Victimization in Contexts and at Places

Although routine activity theory has been predominantly applied to understanding victimization risk across individuals, other applications focus on

understanding how victimization risk varies across spatial units. After all, researchers know that crime is spatially clustered rather than being distributed randomly across geographic spaces. The spatial units that have been considered vary in size from larger “macrolevel” units such as neighborhoods or even metropolitan areas (i.e., standard metropolitan statistical areas) to smaller “microlevel” units such as street segments or specific addresses. For instance, a large body of community-level research has found that rates of victimization are much higher in some neighborhoods than others. Considering smaller spatial units, research also reveals patterning at the level of street block and/or face block. Widely cited research by Lawrence Sherman, Patrick Gartin, and Michael Buerger in 1989 reported crime clustering at an even smaller level of analysis—“the place level.” They studied calls for police service in Minneapolis during a 1-year period; this resulted in analysis of 323,979 incidents. These calls for service could have come from any of the 115,000 places, which are defined as addresses or intersections within the city. Rather than crime reports being spread across all 115,000 places, however, it was markedly concentrated. In fact, most places did not experience any calls, whereas a small fraction of places accounted for the bulk of the total calls. More specifically, Sherman et al.’s analysis showed that 50% of all of the calls occurred at just 3% of the possible places.

As a whole, then, research shows various types of crime concentrations, forming everything from “hot areas” to “hot spots.” The underlying premise of a “routine activity theory of context/place” is that such hot areas and hot spots emerge because various social contexts or places can be viewed as having characteristics related to opportunity, just as can individuals. For instance, some neighborhoods are in closer proximity to areas of high-offender concentration in comparison with other neighborhoods. Additionally, some neighborhoods are more accessible to offenders than are other neighborhoods. Some places contain a greater supply of attractive targets than do other places. Other places provide a poorer overall level of security or potential for surveillance/guardianship than do others. Such areas and places offer more opportunity for crime. Hence, the rates of victimization within these areas and places are likely to be higher.

Place Management

Consistent with the idea that some contexts support victimization more so than do others, “place management” has become a particularly relevant theoretical concept. Put simply, the way specific places (i.e., bars, schools, convenience stores, and apartments) are managed can affect crime and victimization opportunities at the place. The rate of bar brawls, for instance, can be related to such things such as the layout of the bar in relation to a dance floor (so as to minimize crowding), drink prices, bar policy on serving to intoxicated customers, and training offered to service and security staff. Victimization, in short, can be controlled through place-specific, management-related policy and practice.

Offender Searches and Crime/Victimization Patterns

The crime and victimization patterns noted in the above research on neighborhoods, streets, and specific places comport well with the theoretical work of criminologists Paul and Patricia Brantingham. The Brantinghams suggest that offenders have routine activity patterns just the same as victims do, and their “search for crime” is likely to coincide with their daily patterns of movement. As such, offenders are likely to choose attractive targets at their places of routine activity, which include areas near their residence, major businesses/workplaces, large shopping or entertainment areas, and large schools or universities. Such nodes of activity, then, are at higher risk of becoming hot spots of crime because they have a higher likelihood of bringing motivated offenders into contact with suitable targets throughout the course of everyday routine activities. These nodes are “crime generators,” in a sense, because of the opportunities presented. The intended function of the node is not crime; yet opportunity for crime is so plentiful in comparison with other places just in terms of exposure between motivated offenders and suitable targets alone that they can be said to generate crime.

Major routes (streets, walkways, etc.) that connect various nodes also provide substantial opportunity for victimization. Again, as motivated offenders travel about their daily activities, from point A to point B to point C, major thoroughfares

(what Brantingham and Brantingham refer to as “paths”) serve as places where offenders can come into contact with an abundance of suitable targets. In sum, chances are that motivated offenders will encounter targets for victimization that meet their liking at major nodes and along major paths; these chances are much greater than at places that are “off the beaten path.” Noncentral or isolated places are less likely to be encountered by both victims and offenders, thus reducing the likelihood that they will become hot spots of crime and victimization. Some central nodes and pathways will be so opportunistic, according to the work Brantingham and Brantingham, that they will actually become “crime attractors”—places that offenders actually go to specifically for crime purposes.

Beyond major nodes and pathways, another type of place that is particularly opportunistic is referred to as “edge space.” According to Brantingham and Brantingham, edge spaces are boundaries, in essence, which can take a variety of forms. Edges form the transition from one space to another. As such, there are sometimes multiple users of edge spaces; those who use each space often converge and “cross over” at the edges. Because of that, ambiguity can develop in terms of who is in charge of the space—who really owns the space.

As an example, think of the few streets that serve as the edge of a residential neighborhood that is adjacent to a commercial entertainment district. Such a neighborhood, especially near the perimeter, experiences outsiders coming onto its streets regularly. These outsiders often seek parking in the neighborhood or they cut through the neighborhood after entering or exiting the commercial district. Based on this adjacency, residents along the neighborhood’s edges may suffer higher rates of victimization in the form of auto theft and vandalism as well as suffering from “victimless” crimes such as public intoxication and noise violations. The drunk and disorderly behavior that is part of the late-night entertainment venues in the commercial district spills over from the commercial property itself to the adjoining area. At the edge of the neighborhood—in contrast to the core/interior—the people and property are more exposed to motivated offenders, and a higher concentration of suitable targets is found. Also, because of the sheer volume of traffic, residents are overwhelmed when it comes to providing guardianship. In short, edges

are transitional zones between two more clearly distinct physical spaces that have particularly high rates of victimization because of a greater likelihood of a convergence of motivated offenders, suitable targets, and absence of capable guardianship that is created by adjacency.

Multilevel Opportunity

An overview of the discussion to this point reveals that victimization opportunity has been theorized to exist at multiple levels of analysis. For instance, Cohen and Felson’s original statement on routine activity theory was a macro-level one, focusing on opportunity as provided by national-level activity patterns over time. Other researchers since the late 1970s have underscored the importance of opportunity at various levels of aggregation, including cities and neighborhoods. Other work has emphasized microlevel variation, including how specific places and people differ in terms of opportunity. Taking all these theoretical perspectives together, then, it is clear that “victim opportunity” can exist in multiple realms. Multilevel opportunity theory has been developed to address this idea. From a multilevel perspective, a complete understanding of individual victimization risk needs to consider the opportunities presented not only by the individual’s lifestyle/routine activities but also the opportunities presented by the environmental contexts in which the individual is embedded, including the specific places, neighborhoods, cities, and so on, within which the individual moves about his or her daily activities.

In addition to recognizing that opportunities for crime can come from multiple realms, multilevel opportunity theory suggests that opportunity factors interact across realms such that “individual risk factors for victimization” do not, in fact, pose the same risk regardless of context. From this perspective, an overall risk of victimization involves a complex interplay between individual risk factors in combination with risk in the multiple environments in which the individual is embedded.

Structural-Choice Theory

Related to the multilevel opportunity perspective outlined above, Terance Miethe and Robert Meier proposed a multilevel “structural-choice theory” of victimization in their 1994 book titled

Crime and Its Social Context: Toward an Integrated Theory of Offenders, Victims and Situations. On the one hand, like the multilevel opportunity perspective, the structural-choice perspective views crime and victimization as a result of factors at multiple levels of analysis. However, according to Miethe and Meier, criminal opportunities are largely provided by individual-level characteristics of victims (i.e., their individual-level exposure, target suitability, and guardianship practices). On the other hand, environmental conditions provide *motivation* for the offender. For instance, neighborhoods with poor socioeconomic conditions, high rates of residential mobility, and ethnic heterogeneity create “socially disorganized” climates conducive to producing criminality among their inhabitants. According to Miethe and Meier, crime is a function of both the criminality-producing structural factors in the environment and the indicators of vulnerability among individual citizens, which makes them more or less likely to be chosen as targets/victims.

Victim Precipitation Theory

Another line of thought in trying to understand victimization is the idea that victims may precipitate or provoke their own victimization. The classic criminological statement on this perspective was provided by Marvin Wolfgang in 1958. Wolfgang’s analysis of homicide in Philadelphia found that a substantial percentage of murders analyzed (approximately 25%) resulted from a victim–offender interaction that actually began with aggressive actions on the part of the eventual homicide victim. Wolfgang implied, therefore, that many victims are not merely innocent victims but sometimes suffer violence that is precipitated by their own violent or threatening actions. The victim’s actions are presumed to provide criminal motivation for the offender.

The Situated Transaction

Wolfgang’s research and its theoretical implications regarding victim precipitation generated a tremendous amount of controversy. There was a tendency for the theory to be viewed as one that blames victims and mitigates the actions of perpetrators. Regardless of its political unpopularity,

there was and still remains substantial empirical evidence that victimization and offending behavior are correlated and that many criminal events involve retaliatory violence. To address these facts, yet skirt the problem of blaming the victim for motivating the offender, more recent theoretical approaches have moved away from a narrow victim-precipitation perspective toward a broader, fuller analysis of the dynamic between victim and offender and the unfolding of the criminal event. David Luckenbill, for instance, coined the term *situated transaction* to explain victimization. His idea was that violent victimization—in particular, homicides and physical assaults—emerged from a pattern of interaction (a transaction) between victim and offender that typically starts with an insult of some sort and eventually escalates to a violent outburst. However, the insult rarely immediately precipitates offender violence. Instead, a “back-and-forth” occurs between victim and offender whereby insults are followed by counterinsults as efforts to “save face.” Eventually, this dynamic, which revolves around the protection of honor, may lead to actual violent victimization. From this perspective, however, either the victim or offender in the eventual violent outcome can pull out of the exchange or respond in nonviolent ways.

Conflict/Critical/Feminist Theory

A final theory of victimization to be discussed here—conflict/critical theory, including feminist theory—explains victimization as a result of power differentials between victims and offenders. This perspective is most commonly applied to victimization in which obvious power differences are found between the offender and victim, including sexual assault, child abuse, family violence, and intimate partner violence. Even though there are various brands of conflict theory, the overarching theme is that an offender’s victimization of another is an expression of domination and control. Such expressions of domination and control are presumed to stem from broad structural inequalities—based on age and gender, for instance—and corresponding patriarchal societal values emphasizing dominant males and subordinate yet manipulative (especially sexually) females. Thus, crimes like sexual assault, intimate partner violence, and stalking are viewed as expressions of traditional gender role

socialization and methods of maintaining the status quo regarding power and control in interpersonal relationships and society more broadly (see, e.g., Brownmiller, 1975; Russell, 1975).

The conflict perspective is not only helpful in understanding why some victimization may occur, but also it is useful in understanding differential responses to victimization. Sexual assault and domestic physical assaults, for instance, are crimes that have been notoriously underreported by victims to police. Conflict perspectives suggest that this underreporting largely stems from biased and inappropriate treatment of victims of such crimes by agents within the criminal justice system, from police and prosecutors to juries and judges. Research has, indeed, documented degrading and belittling of rape victims by some police officers. Additionally, the reluctance of courts to prosecute and convict rapists has also been noted. Conflict theorists argue that, when social control is enacted on rapists (i.e., in the form of arrest, prosecution, and conviction), it seems to be biased in favor of upholding the status quo in terms of race, class, and gender and sexuality norms. For instance, Gary LaFree's extensive research on this issue revealed that the criminal justice system seems more likely to punish offenders who victimize those who are perceived as "traditional, upstanding" women (i.e., White, married, and at home during the assault) while being far more lenient on offenders victimizing women of color and women violating traditional gender norms (i.e., those who are unmarried, hitchhike, have a sexual history, etc.). In short, traditional women were viewed as more credible victims by those in the legal system. Lisa Frohmann's research on prosecutorial decision-making in sexual assault cases provides another example of well-known research supportive of this idea. Her study revealed that many cases were purged from the system because of the prosecutor's perception that the victim was not credible and/or did not present a story that was likely to result in a high rate of conviction. The factors included in that judgment included victim demeanor, place of residence, and victim's initial willingness to have contact with the offender. In sum, some evidence suggests that criminal justice agents construct a definition of a "plausible, typical, winnable" rape case and that social construction seems to be intertwined with power. According

to conflict theory, victims are powerless relative to offenders; yet some victims have greater standing in the eyes of the legal system. Individual victims who uphold the power structure in terms of race, class, and traditional notions of gender are far more likely to experience justice.

Toward a Comprehensive Understanding of Victimization

Theories of victimization are varied. They include those that focus on victimization as a function of opportunity (at various levels of analysis), those that focus on victimization as a function of social interactional dynamics between victim and offender, and those that focus on victimization as a function of deep social division in terms of power and control. All such varied perspectives have received empirical support in the research literature. As such, victimization is clearly a complex phenomenon, which results from a multitude of broad social and microsituational influences. Although these theories tend to be viewed as "competing" and studied in isolation, there is little doubt that all have merit and assist in providing a comprehensive understanding of victimization.

VICTIMIZATION SURVEYS

For a long time, researchers have been interested in understanding the extent, nature, and consequences of property and personal victimization. Until the 1970s, however, official police records were the only large-scale source of data available to investigate questions about victimization. Although clearly useful sources of data, these records are also characterized by several well-documented limitations. And these limitations make questionable some findings derived from them. For example, using police records, it is unclear whether the extent of violence has really changed over time or whether only the amount of violence coming to the attention of the police has changed over time. In fact, using police records, one cannot learn anything about property or personal victimization that

did not come to the attention of the police. Furthermore, using police records, one could not be certain that changes in crime rates demonstrated by official statistics were not just changes in police practices and policies. Even if police records were perfect and all crime was reported to the police, these data do not enable an examination of many aspects of victimization. For example, one could not learn about injuries sustained by the victim of these crimes, about reasons people chose to contact the police, or whether medical attention was obtained by the victim.

In an effort to address this large gap in our understanding of victimization, the United States embarked on a bold endeavor beginning in the 1960s that ultimately led to the first omnibus victimization survey to gather property and personal crime victimization data from a nationally representative sample. Dubbed the National Crime Survey (NCS) and later renamed the National Crime Victimization Survey (NCVS), these data are responsible for much of our extant knowledge about violent and property victimization. For example, using data from the NCS, it is possible to ascertain actual risk of victimization by victim characteristics, details on the victim and offender relationship, the proportion of violence that involves an armed offender, how victims respond to violent victimization, and the percentage of victimization that comes to the attention of the police. Given the innovative methodological protocols used to produce reliable estimates of victimization found in the survey, it is no surprise that the NCS served as a model for additional victimization surveys in the United States (e.g., the Illinois Victimization Survey, the Anchorage Victimization Survey, the National Violence Against Women Survey), in other countries (e.g., the British Crime Surveys, the Scottish Crime Survey), and even an international survey (i.e., the International Crime Victimization Survey).

The purpose of this entry is to present basic information about victimization surveys. The entry is divided into several sections. The first answers a basic question: Why are victimization surveys important? The second section discusses the basic characteristics of victimization surveys. In other words, what do victimization surveys look like? The third section addresses changes implemented over time in victimization surveys to address

changes in methodology and society. And finally, the last sections provide examples of domestic and international victimization surveys publicly available today, including newer surveys.

Why Are Victimization Surveys Important?

Before the advent of victimization surveys, researchers and policy makers had only data from official police records and collected by the Federal Bureau of Investigation (FBI) in the form of the Uniform Crime Reporting (UCR) Program system and the Supplementary Homicide Report. Although these data have many valuable qualities, they are imperfect sources for understanding the true nature and extent of victimization in the United States. For instance, with only official data, there can be no assessment of the “dark figure of crime.” That is, using official data, one could never learn how much, or the nature of, violent and property victimization that is never reported to the police. A second limitation of using official records to estimate or understand victimization is that the data collected reflects in part law enforcement activity and not the actual extent of crime. For example, police may institute a new initiative to crack down on a particular type of crime. With this emphasis, more of this particular crime may show up in the crime reports. However, this does not indicate an increase in that type of crime, only an increase in attention given to that crime. A third limitation of using official statistics to learn about victimization is that they can be, and on occasion have been, manipulated and misrepresented for a variety of reasons. For instance, in recent years, some cities were found to be failing to document sexual crimes properly making it seem as though these types of crime were greatly declining and relatively rare. And finally, a limitation of official statistics on crime and victimization is that they tend to lack detailed information about the criminal incidents, including details about the characteristics of the victims, offenders, and incidents. Although information on topics such as victim and offender relationship, weapon presence, and offender race is available for homicides, this detailed information is not available on a national basis for nonfatal victimizations. The implementation of the National Incident-Based Reporting System (NIBRS) is slowly changing that

by including many details on nonfatal violence. Unfortunately, however, the coverage of NIBRS continues to be poor. Nonetheless, even if NIBRS had perfect national coverage, many aspects of victimization could not be addressed using police records. One would still have no information on victimization characteristics such as injuries sustained, bystander presence, resistance by the victim, medical treatment sought, whether the victimization was reported to the police and reasons for reporting or failing to report the violence to the police.

When studying subjects, multiple independent measures are desirable. The same rule applies to the study of violence and crime. Initially, with only one measure of victimization available—official police records—many significant policy-relevant questions cannot be investigated. With a second source of data—victimization surveys—information from police records can be complemented to provide a greater understanding of victimization. With victimization surveys, researchers can learn what official records can never convey, such as victim responses and detailed incident characteristics. And with police records, researchers can learn what victimization surveys can never convey. For instance, with the UCR, researchers can study offenses and police departments by state and city; they can investigate violence against persons under age 12; and they can study those not living in a household (i.e., homeless and institutionalized). Victimization surveys and official records are needed because together, used in a complementary fashion, the two overlapping but different measures provide greater coverage of the nation, victims, and victimization to enhance our understanding of victimization.

A Victimization Survey Is Created

With only official records, basic information required to develop policies designed to reduce victimization was lacking. Much more detailed information on both personal and property victimization was sorely required to measure the nature, extent, and consequences of victimization. How these new data—data focusing on victimization—would be gathered had to be developed from scratch. To develop this new methodology, the President’s Commission on Law Enforcement and

the Administration of Justice called for the formation of the first national survey of crime victimization in 1967. It was decided that by going directly to victims of crime, researchers could gather valuable information about crimes reported and not reported to police, collect relevant details concerning the victimization, and be certain that the data were not influenced by changes in law enforcement policies or be manipulated by the unscrupulous.

After completing several pilot victimization studies in a variety of cities, it was concluded that self-report victimization surveys were a reasonable method of identifying and describing criminal victimizations reported and not reported to the police. Based on the feasibility of a victimization survey and on extensive methodological studies, the NCS was created and first implemented in 1972. The NCS had four primary goals. First, it was to provide an independent calibration for the UCR. Second, the NCS was to provide an ongoing measure of victim risk. Third, the NCS would be used as an indicator of the crime problem independent from those generated by police activity. And finally, the NCS would serve as an indicator of society's definitions of crime. Even though these were the primary purposes of the survey, the new victimization survey would also serve several other important purposes. First, it would shift the focus of the criminal justice system to the victim and away from the offender. Second, it would provide an index of changes in police reporting. Third, data gleaned from the NCS would provide a basis for the study of granting of compensation to crime victims. Fourth, it would gather information ascertaining the involvement by the victim in a crime. And finally, it was designed to measure public confidence in police efficiency. When launched, the NCS was composed of four interrelated victimization surveys: a national household sample referred to as the Crime Panel, a Central City household sample, a national sample of commercial establishments, and a Central City sample of commercial establishments. Only the national Crime Panel survey survived beyond 1976.

What Does a Victimization Survey Look Like?

Because the NCS was designed in part to serve as a benchmark for UCR collected by the FBI, the NCS

measured many of the same crimes. In the NCS, data were collected on violent crimes including rape, robbery, aggravated assault, and simple assault. In addition, data on purse snatching and pocket picking—considered nonviolent personal crimes—were gathered. Finally, data on property crimes including burglary, motor vehicle theft and property theft were obtained. Information on threatened, attempted or completed crimes is collected in the NCS.

As the first ongoing national survey of crime, the NCS broke new ground, and as a result, the basic methodology utilized is novel. The data are gathered by the Census Bureau at a sample of housing units and group quarters in the United States and the District of Columbia drawn from the Decennial Census. In each selected sample housing unit, all persons age 12 or older are interviewed about personal victimization experiences in the previous 6 months. In addition, one person in each household—the household respondent—provides information on property crimes experienced by the household (i.e., burglary, motor vehicle theft, and property crime). A second feature of victimization survey methodology is that the interviews are conducted continuously throughout the year in a rotating panel design. That is, the sample of households is divided into six rotation groups. Within each of the six rotation groups, six panels are designated. A different panel is interviewed once every 6 months covering seven interviews. A new rotation group of households enters the sample every 6 months, replacing a group as it is phased out after being in the sample.

A feature developed specifically for victimization surveys concerns the survey instruments. In general, victimization surveys like the NCS and the NCVS use a two-part instrument. The first part, the Basic Screen Questionnaire, is used to determine—or screen for—any crimes that were committed against the household or against an individual household member during the 6-month reference period. There is a screener for personal crimes, which every eligible household member receives. Crimes against a person include rape, sexual assault, robbery, aggravated assault, simple assault, and purse snatching/pocket picking. In addition, one person in the household who is designated the household respondent is given an enhanced crime screener that includes questions about personal crimes they

may have experienced, as well as property crimes that were committed against the household. Household crimes include motor vehicle theft, burglary, and property theft. An example of one of the personal crime screener questions follows:

41a. (Other than any incidents already mentioned,) has anyone attacked or threatened you in any of these ways (Exclude telephone threats)–

- (a) With any weapon, for instance, a gun or knife–
- (b) With anything like a baseball bat, frying pan, scissors, or stick–
- (c) By something thrown, such as a rock or bottle–
- (d) Include any grabbing, punching, or choking–
- (e) Any rape, attempted rape or other type of sexual attack–
- (f) Any face to face threats–

OR

- (g) Any attack or threat or use of force by anyone at all? Please mention it even if you are not certain it was a crime.

41b. Did any incidents of this type happen to you?

41c. How many times?

For every crime revealed by the screener instrument, a second instrument is administered. This second instrument, the Crime Incident Report, is used to gather detailed information about victimizations reported in the screener. One Crime Incident Report is completed for each and every incident reported in response to the screener questions. For example, if a respondent said that he was robbed once and was beaten up twice, then three Crime Incident Reports—one for the robbery, a second for the initial assault, and a third for the second assault—are completed. The details collected on the Crime Incident Report are important because of the way crimes are classified in victimization surveys like the NCS. Crimes are classified not based on what the victim states (i.e., my house was robbed!), and they are not classified based on the field representative's impressions. Instead,

incidents are classified as a crime and are categorized as a particular type of crime based on the details gathered in the incident report. For instance, if a victim discusses an incident in which no sexual assault occurred (therefore no sexual assault or rape), a weapon was brandished by the offender (aggravated assault characteristic), and the victim was seriously injured (aggravated assault characteristic), then the incident would be classified as an aggravated assault. Or for example, one may speak of an incident where an offender attacked a victim (no weapon used, thus a simple assault), knocking them to the ground causing bruises and a chipped tooth (minor injuries). Because this incident did not involve a sexual assault, weapons, or a serious injury, it would be coded as a simple assault. In victimization surveys, incident details are incredibly important. Without these details, a crime cannot be properly classified.

In some instances, the respondent cannot provide the details of each incident. For example, an individual may have been repeatedly assaulted by her spouse (e.g., about 45 times) during the preceding 6-month reference period. Or a student may have been beaten up and harassed by the school bully daily during the 6-month reference period. Victimization survey methodology requires an incident report be filled for every one of these events. It is often the case in repeat victimization situations that the respondent cannot provide the details of each and every incident. For circumstances like this, a “series victimization protocol” is used. In cases in which several incidents of a similar nature have occurred, in which the respondent cannot provide details of each, the details of only the most recent incident in the series of incidents are recorded in the incident report as a “series victimization.”

Victimization Surveys: Works in Progress

Since the inception of the first NCS, the survey has been a work in progress. It has been modified many times to reduce costs as surveying costs have increased, as well as to improve quality based on extensive methodological research designed to improve the survey. One way that costs in conducting surveys have been reduced over time is by reducing the number of in-person interviews and

increasing the percentage of interviews conducted by telephone. Originally in the NCS, initial contacts for each of the seven interviews were conducted in person. The number of in-person interviews has decreased steadily over time to the current state of the NCVS, where only the first interview contact is made in person. This does not mean that all household members are interviewed in person the first time. It means only that the first interview of the household respondent is required to be conducted in person. From this point on, it is the respondent who selects whether future interviews are conducted in person or over the phone. Additional cost savings introduced to the survey over time included several sample size reductions. In the NCS, originally about 72,000 households were drawn in sample. Over time, the sample size has been cut several times resulting in the current sample size of about 42,000 households. The cost savings incurred in this massive reduction in sample has led to a situation in which the survey simply cannot be cut any more. With a significantly smaller sample in conjunction with the drop in crime since the mid-1990s, the survey now struggles to measure relatively rare crimes such as rape and robbery with much precision.

Many methodological changes have been implemented over time to improve the quality of the victimization data gathered. As the survey aged, many questions were added to and other questions were changed in the survey instruments. These new and revised questions reflect the survey being responsive to the changes in the needs of policy makers, as well providing information on topics of interest to the general public. As a result, the incident report expanded from 4 pages to more than 18 pages. With these new questions, as well as the enhancements to existing questions, the survey gathers information about the characteristics and consequences of violence, such as self-protective actions by victims, gang violence, bystander behavior, use of weapons, details of the location of the violence, reason for reporting as well as reasons for not reporting the violence to the police, and drug/alcohol use by the offender. An additional methodological change to the victimization survey enabled it to take advantage of the advent of computer-assisted telephone interviewing (CATI). CATI was introduced to the NCS sample in 1988, when 5% of the victimization survey sample was

interviewed using this method. Since this time, the percentage of the sample interviewed via CATI has increased steadily.

Although changes to the victimization survey have been ongoing, the largest changes to the survey came in the form of a redesign. Planning for the redesign began in 1979, and the final product was implemented in 1992 using a split sample design. It was at this time that the NCS changed names to the NCVS. The purpose of this major redesign was to improve the survey's ability to measure victimization in general with an emphasis on better measuring difficult-to-measure crimes, such as rape, sexual assault, and domestic violence. Improvements came primarily in the form of improvements to the screener instrument. These improvements included extensive screener cue changes that better prompted respondents' memories of victimizations. In addition, changes to the screener minimized the increasing complexity of the instrument. Following the redesign, the NCVS gathered detailed information on an increased number of crimes. The redesigned crime survey increased the scope of crimes specifically included in the screener to include rape and sexual assault, domestic violence, and vandalism. Prior to the redesign, the NCS did not screen for rape but estimated these crimes based on information obtained about these offenses in screens focusing on attacks and attempted attacks. And prior to the redesign, no information was gathered on sexual assault.

Given the improved cues adopted on the screener, the survey counted an increased number of crimes after the redesign. As anticipated, these increases were not uniform across types of crime. Increases in crimes *not* reported to the police were greater than the increases in crimes reported to the police. This change is likely because of the improved cues implemented for certain questions, which caused respondents to recall more of the less serious crimes—those that are also less likely to be reported to law enforcement officials. In the end, the percentage of crimes reported to police based on the redesigned survey is lower than the percentage calculated based on data collected with the previous survey design. This difference is particularly the case for crimes like simple assault, which does not involve the presence of weapons or serious injury.

What Victimization Surveys Are Available Today?

The NCS was the first national victimization survey launched. Attention to this survey prompted many advances in our understanding of victimization survey methodology. Building on the NCS template, numerous victimization surveys at the city (e.g., Anchorage Adult Criminal Victimization Survey, City of Buffalo), state, country, and even international level have since been fielded. Not only do these surveys vary based on geographic areas of interest, but also they differ in terms of methodology and focus. Some victimization surveys gather information about specific types of violence. For instance, Georgia fielded a victimization survey that focused on school violence. The National Violence Against Women Survey in the United States and the Violence Against Women survey in Canada focused on violence against women. The Sexual Victimization of College Women survey was conducted in the United States and focused not just on women but specifically on women in college.

Some victimization surveys focus on violence and property crime in a particular state. Among those states that have fielded a victimization survey are Hawaii, Nevada, Idaho, Oregon, Pennsylvania, Wyoming, Minnesota, Illinois, Maine, and Iowa. Because victimization surveys are expensive to implement, most state surveys have been one-time events, although some exceptions exist. One of the earliest state victimization surveys and one that has been repeatedly fielded is found in Minnesota (1993, 1996, 1999, 2002, and 2005). The overall purpose of the survey is to gather information on victimization experiences as well as information on respondents' perceptions of crime and safety. The sampling frame used in Minnesota is based on driver's licenses and state-issued identification cards. The survey is conducted using the mail and with additional measures aimed to boost response (e.g., postcard reminders); response rates have been relatively high. In the 2002 survey, 42% of the surveys were completed. Similarly, in 1999, a 48% response rate was obtained. Not surprisingly, the nature of the survey has changed over time to reflect changing needs of its constituents. For instance, after the attacks on September 11, 2001, the 2002 survey gathered data on respondents' fear of a terrorist attack.

The state of Utah has also fielded multiple victimization surveys. Unlike Minnesota, however, these surveys have not been conducted on a regular basis (2000, 2002, and 2005). In addition to the overall victimization survey, a separate survey focusing sexual violence was administered to a sample of females aged 18 or older. The Utah surveys use a 12-month reference period and gather information on "lifetime victimization" of its residents. In addition to just crime victimization data, the Utah survey gathers data on attitudes and perceptions of crime designed to measure, among other things, residents' fear of crime. Initially, the 2000 and 2002 surveys were conducted via mail, which resulted in disappointing response rates. In 2005, the survey began to use random-digit dialing, with calls being made until the desired sample size was achieved.

An example of a one-time survey is found in the state of Illinois. In 2002, the state mailed victimization surveys to 7,500 residents based on Illinois state driver's licenses and state identification cards. The survey focused only on those residents 18 or older. After repeated reminders, the states received 1,602 surveys for a response rate of about 28%. Since receiving completed surveys, multiple reports have been completed that suggest, among other things, that Black and Hispanic males are victimized at higher rates than White males, that only 44% of violence is reported to the police, and that reporting to the police is not consistent across personal demographic characteristics.

Some victimization surveys cover entire countries. According to one inventory sponsored by the United Nations Economic Commission for Europe and the United Nations Office on Drugs and Crime, 62 countrywide victimization surveys were conducted as of 2006. Approximately two thirds of these surveys were purely victimization surveys (e.g., Scottish Crime Survey, British Crime Survey, and Northern Ireland), whereas the remainder were victimization components of more general surveys (e.g., Australia and Canada). One of the most widely known country survey is the British Crime Survey (BCS), which collects data on England and Wales.

The BCS gathers victimization data on persons age 16 or older in England and Wales. The survey has been conducted since 1982. Initially, it was fielded with few exceptions on a biennial basis (1982, 1984, 1988, 1992, 1994, 1996, 1998, and 2000). Since 2001, the survey has been conducted

continuously. Initially, the purpose of the BCS was to investigate individual risk of victimization, estimate crime, and ascertain people's concern with crime and their perceptions of the police. Currently, the survey is also charged with providing reliable information about crime trends in England and Wales. Like the NCVS, the BCS population includes noninstitutionalized persons. However, unlike the NCVS, the BCS uses a 12-month reference period. This large survey has generated much information of interest to the public as well as policy makers. Among some recent findings include a decrease in victimization risk between 2007 and 2008. In addition, findings show a 22% decrease in firearm victimizations during that 1-year period.

Although some countries gather national victimization data, many other countries participate in the International Crime Victimization Survey (ICVS). To date, this survey includes about 56 countries with samples of between 1,000 and 2,000 households. One person in the selected household is interviewed. The ICVS is best described as a set of victimization surveys constructed to allow for cross-national comparison of victimization. The ICVS was first fielded in 1989. Since then, it has been fielded again in 1992, 1996–1997, and 2000. Like the NCVS, the surveys in the ICVS are conducted using CATI and in-person interviewing. Two reference periods are used in the survey—a 5-year as well as a 1-year reference period. The ICVS gathers data on personal assaults, robbery, personal theft, burglary, motor vehicle theft, and bicycle theft. Like some other victimization surveys, the ICVS also gathers information on more than street crimes. For instance, in 1996 the ICVS included a question on bribe victimization. Countries that participate in the survey use a core set of questions in the interviews to allow cross-national comparison. In addition, they are afforded some flexibility to adjust the instrument to meet their specific needs.

Another example of an international victimization survey is the International Violence Against Women Survey (IVAWS). This comparative survey gathers information on male-perpetrated physical and sexual violence against women and is based on the infrastructure and methodology of the ICVS. The survey is not described as a violence against women survey but instead a personal safety survey. The measures used in the IVAWS build on those from the first national violence against

women survey fielded in Canada in 1993. Data collection began in 2003 using both telephone and in-person surveying in more than 70 countries. In 2005, comparative analyses on the first set of data began.

Newer Surveys

Given extant victimization survey methodology, there are no limits beyond cost to what information about victimization can be collected. Making fielding a victimization survey easier is software provided free of charge called the Crime Victimization Survey (CVS) Software. This software was developed by the Bureau of Justice Statistics—the sponsor of the NCVS—and the Office of Community Oriented Policing Services in the Department of Justice; it is designed to facilitate entities such as police departments to conduct their own victimization surveys. The CVS software duplicates the questions asked in the NCVS. In addition, it includes a section that queries respondents about issues related to community policing. Plus, the survey allows for users to modify their own survey to gather data on issues of local interest. These newer surveys come in many shapes and forms, but all have the underlying goal of better understanding the nature and extent of victimization.

VICTIMLESS CRIMES

Victimless crimes, which are also known as consensual crimes, are generally defined as crimes in which no one is hurt; in other words, there is no direct victim because individuals *choose* to participate. These are *mala prohibita* crimes, that is, they are crimes because the state has said so and not because they are behaviors that are inherently evil. They include the following: gambling, substance abuse (particularly individual substance abuse), prostitution, obscenity and pornography, and the failure to use safety devices (e.g., seat belts and helmets). In some instances, homosexuality and abortion have also been considered victimless crimes.

These crimes occupy a huge amount of criminal justice attention and taxpayer dollars, with more

than 4 million arrests nationwide each year. This leads to more than 350,000 persons serving jail time and an additional 1.5 million persons on probation or parole. For many of these crimes, the victims and the perpetrators are one and the same. In prostitution, for example, it is often argued the victim is the prostitute (either male or female), but when the client (“John”) is robbed, assaulted, or even killed, are they not (also) the victim? And if a person chooses to engage in the sex-for-hire occupation, are they really a victim? It is, in many cases, a tangled web. Either way, the net effect is to cost taxpayers \$50 billion to punish people who have arguably done no harm to anyone except possibly themselves. Why?

One quality that victimless crimes share is that someone finds them morally offensive. Peter McWilliams suggests, however, that crimes are not moral. The question, for him and others with respect to victimless crimes, is “Does it make any sense to put people in jail for doing things to *themselves* that do not harm the person or property of others?”

The question becomes, is it necessary for a direct victim to exist for something to be a crime? Essentially, in these cases, it is about legislating morality, and yet some believe that morality cannot be legislated. Others believe that morality should not be legislated. The reality is that with every law passed, someone or some group’s morality is being legislated.

Many argue that what one does to himself or herself is their business, and in most of these crimes it is someone doing something to themselves, and again, no one should be incarcerated for harming just themselves. Although there may be emotional harm to others (e.g., the husband of an alcoholic) and as bad as that might be, it does not warrant the “offender” being put in jail or prison. A variety of other reasons variety been suggested for why these behaviors should be illegal, including it’s un-American and unconstitutional, such laws violate the separation of church and state, it is expensive, destroys lives, it encourages real crimes, it corrupts law enforcement, and it promotes organized crime. It is certainly true that most cases of law enforcement corruption do tend to involve consensual crime, but should preventing potential police corruption play a role in determining what behaviors should be illegal? Would police corruption be reduced, for example, if prostitution were legal? Drugs?

Pornography? The correct answer probably is, who knows? Many of these crimes are legal in other countries and in some places in the United States.

If one believes that all legislation (i.e., all laws) is morality driven, then creating crime legislation is not only constitutional but also necessary and unavoidable. There is no question that having laws reduces the frequency of the illegal behavior. With respect to victimless crimes, it is often argued that people will commit the crime anyway, so why make it illegal? Although this argument is true, there are also laws against murder, and yet people commit murder, as well as rape, burglary, auto theft, and the like. Should we make everything legal so as to avoid the multitude of costs associated with enforcing the law? The idea of consensual crimes is an emotional issue, which is made all the more so if one considers homosexuality and abortion.

Oftentimes, the arguments for and against rely more on emotion than anything else. In 2009, for example, the city of San Francisco is considering legalizing prostitution. For many, this is a sign of change and hope for women; for others, it is just San Francisco being San Francisco, again emotion more than anything else. With regard to prostitution, the woman may be a victim, but whether she chooses to engage in that activity is not always easy to identify. Similarly, can one choose to be a victim? People like McWilliams would certainly agree that they can; Frank Turek and Norman Geisler would argue that they cannot (or perhaps even should not).

One might think that the argument of consensual crimes turns on one's political ideology with those leaning right being in favor of legalization and those leaning left against legalization. Although that is generally the case, the issue of substance abuse is one example where conservatives and liberals are in favor of legalization. Clearly the lines for and against consensual crimes seem blurred depending on which crime is being discussed.

There are alternatives to criminal justice intervention in victimless crimes. Prostitution, for example, could be legalized, traced, and regulated, which is the situation in Nevada. Many drug-related issues could be moved into the medical realm where treatment would be available. Clearly, this is the case with drug courts where criminal justice and health services are merged in generally good ways.

These alternatives have the obvious benefit of removing a problem from the criminal justice

realm. Prison overcrowding, overburdened courts, and levels of official corruption would all be lessened. However, for those supportive of laws that enforce a moral standard, these alternatives are clearly an official sanction for an objectionable behavior (and what the state should be doing). The short-term interest in saying no has outweighed the long-term potential for significant reductions in the behaviors.

Additionally, alternatives to criminal justice intervention are not free. The medical treatment for drug-related problems is expensive. Costs would have to be paid for by taxes, insurance, and possibly cuts in state budgets to include criminal justice. Prostitution is perhaps easier—legalization can include taxes, licensing fees, and so on. Requirements that prostitutes be frequently tested for sexually transmitted diseases and HIV/AIDS may also result in a decrease in the spread of disease and therefore a decrease in associated medical costs.

Whether something should be a crime or not is the purview of a state legislature. As such, it seems reasonable that each state should decide for themselves which consensual crimes should be criminal. Of course, this means that what might be a crime in one state might not be a crime in another. For some, this is a fundamental constitutional issue. For others, we must have federal laws to protect us from ourselves. The arguments on both sides are reasonable as are most of the arguments for and against consensual crimes. What will happen in the future is difficult to predict, although no immediate evidence suggests that any of these crimes will be legalized on a widespread basis. The arguments for and against will no doubt continue.

VICTIM–OFFENDER MEDIATION

Victim–offender mediation (VOM) is a restorative justice approach that brings together the victim and offender for a face-to-face meeting in the presence of a mediator. VOMs allow those most directly affected by a crime the opportunity to share their stories and have their voices heard while working toward a mutually agreeable solution or reparations when appropriate. VOM is distinguished from a more traditional settlement-driven approach to conflict whereby certain outcomes, including restitution, are emphasized. As described by Mark Umbreit, VOM is considered a type of humanistic-driven mediation that focuses on creating dialog with an emphasis on healing, accountability, and restoration. VOM programs are currently one of the most widely used restorative justice practices in the United States. The restorative justice paradigm views crime as a violation not only of the law but also of the relationships between members of communities. Although VOM generally involves three groups of individuals, which includes the victim, the offender, and a mediator (usually a trained volunteer), it is not limited to only those individuals. In cases with more than one victim or offender, multiple parties may be involved in the mediation process. Mediations may also include support persons for the victim and/or offender as well as community members.

Prevalence of Programs

VOM programs are one of the most popular restorative justice practices in the United States. Umbreit, Betty Vos, Robert Coates, and Katherine Brown estimate that more than 300 VOM programs exist in the United States, and more than 1,000 programs are in use in other nations. After its inception, VOM was used almost exclusively

with juvenile offenders who had committed relatively minor, nonviolent offenses, in most cases misdemeanors. For example, in the 1970s in Kitchener, Ontario, in one of the first mediations of its kind, youths who went on a vandalism spree were ordered to meet with those individuals and businesses whose property they had damaged. Whereas today VOM is still widely used with nonviolent juveniles as a diversionary option or alternative to other correctional sanctions, these types of mediations are used increasingly with adult offenders as well as individuals who have committed serious and violent offenses. Now, many programs bring together victims and offenders who have experienced violent crime, including homicide, in a face-to-face meeting. These types of mediations offer victims and offenders the opportunity to speak to each other in a way generally not allowed or even discouraged within the criminal justice system. Mediations involving serious violence are almost always initiated by a victim or family member of a deceased victim.

Elements

Victim–offender mediation programs exist under a variety of names. Some of the first programs bringing together victims and offenders were known as victim–offender reconciliation programs. Some programs today still use this title to describe the mediation process. However, not all were comfortable with the faith-based concept of reconciliation, which implied forgiveness between parties. Mediations are now more often referred to as victim–offender dialog, victim–offender conferencing, and of course victim–offender mediation. Although not all VOM programs look alike, most mediations share some core elements. And even though there is much focus on the face-to-face encounter between the victim and offender, VOM programs should be thought of not as a singular event but as a process. Umbreit, Coates, and Vos describe similar elements and phases within the mediation process. First, cases are generally referred to mediation through the courts, probation departments, police, or other community organizations or agencies. Mediations may also be initiated when a crime victim requests a meeting with an offender. Once a case is referred or mediation is requested, a trained mediator is assigned and all potential participants in the

process are contacted. The element of voluntary participation is important in this process. Because the decision to seek mediation is often left to criminal justice officials, it is important that both victim and offender agree to participate voluntarily and are comfortable engaging in the process.

The next stage, preparation, involves prepping the individuals participating in the mediation for the actual face-to-face meeting. During this stage, the mediator talks with both the victim and offender about the mediation process. This session helps to provide a better understanding of the purposes of mediation and answers any questions people have about the meeting. Preparation is an extremely important component of the process. Participants must understand its structure and purpose, and this stage allows both victims and offenders the opportunity to ask questions about how things will go. It is not uncommon for individuals to feel anxious or nervous about the face-to-face meeting, and the preparation stage allows individuals an opportunity to discuss their concerns. This stage can last anywhere from a few hours to a year or more, which often depends on the seriousness of the offense.

During the actual mediation session, the victim and the offender are seated in the same room. In most cases, this is the first chance for those intimately involved to discuss the crime directly. For victims, this may be the first time they are allowed to describe the harm they experienced to the individual who harmed them. For offenders, it is an opportunity to listen and speak directly to the victim. The purpose of the session is not to place blame or determine guilt but to promote dialog between the parties. The session is an opportunity for both the victim and offender to tell their stories in a safe environment. Together, they might come to an agreed-on outcome like restitution payments, depending on the type of crime committed. After the session has ended, the process is not over. Mediations include a follow-up session that allows individuals involved in the session an opportunity to discuss any problems or concerns that remain, as well as their overall feelings about the meeting. This follow-up can be thought of as a general “checking in” of sorts. Mediation staff can assess how restitution or other agreeable solutions are being met. At this time, the principals may be referred to other service providers for additional support.

An Evidence-Based Practice

VOM programs are an empirically grounded practice and thus a significant body of research focuses on these programs. Research has examined why people participate, client satisfaction rates, and common outcomes related to mediations. Victims and offenders often differ in their reasons for participation. As described, some mediations are mandated or provided as an alternative to a more traditional criminal justice process, whereas others are requested by the victim. Victims who choose to participate do so for a variety of reasons and motivations, such as follows: to tell their story, to hold the offender accountable for his or her actions, to seek restitution, or to seek answers to questions. Offenders also express a variety of motivations that may be influenced or mediated by the level of voluntariness they are afforded. Many describe a desire to take responsibility for their actions, to speak directly to victims, to tell their side of the story, to avoid court, to relieve feelings of guilt, or to give something back to the victim or victim’s family.

The reported levels of satisfaction for these types of programs are generally high. A significant portion of those who participate in VOM express high levels of satisfaction with the process and with the outcomes achieved. Furthermore, those who do participate in VOM are more likely to feel satisfied with the criminal justice process when compared with those who do not. Victims report feeling less fearful and less angry after being part of the mediation. Offenders also express positive benefits from their involvement in mediation, and victims and offenders alike describe a sort of humanizing experience, getting to know the other individual as a person. Victims and offenders are often asked about their perceptions of fairness, which includes how they felt about the mediation overall. Most victims and offenders report feelings of fairness. These types of mediations have also been evaluated for their potential to influence recidivism. Studies in this regard show their promise. In a meta-analysis of VOM programs, Umbreit, Coates, and Vos found that mediations are at least as effective, and in some cases more effective, in reducing recidivism when compared with traditional criminal justice options.

A Critical Analysis

Although an abundance of literature speaks to the positive effects of VOM, this process has not been without its critics. Perhaps the most important issue for consideration is the voluntary nature of the process. It is important that neither the victim nor the offender feel coerced to participate and that the mediation itself be fully voluntary to be truly restorative. If a victim feels pressured to participate, then significant potential exists for that person to feel revictimized. Offenders may also feel coerced to participate when they are offered mediation as an alternative to probation or more severe criminal justice sanctions. Special attention must be paid to juveniles who are even more susceptible to coercion by the state, in particular because of the power imbalance between young and old. Furthermore, participation is a highly selective process. Umbreit, Coates, and Vos note that on average, 40% to 60% of victims given the opportunity to participate in mediation do not. Therefore, the individuals who do opt to participate in the process may be unique from those that do not; this area needs more research.

Another important concern focuses on who retains “ownership” of the process and the programs of which they are a part. Many programs operate within traditional criminal justice systems, which raises questions about the truly restorative nature of such mediations. Finally, more research is needed to understand how offenders’ needs are met in these situations. Despite any critiques leveled at it, VOM remains a promising and viable alternative to the traditional criminal justice system where victims and offenders can share their stories.

VICTIMOLOGY

For years, people who were interested in criminology and criminal justice riveted their attention on offenders. Criminologists, on the one hand, tried to determine why people broke the law and examined the nature of those transgressions. Criminal justices, on the other hand, focused more on the ways the authorities reacted to crime and how violators were processed through the system. One might characterize both of these orientations more aptly as “offenderology,” or the study of offenders.

Over time, a new orientation began to unfold. This perspective shifted attention away from the offender and turned instead to the forgotten side of the criminal dyad: the victim. Every crime, by definition, has a criminal and also a victim. Proponents claimed that criminology and criminal justice inadvertently had become too exclusive and overly

myopic. Among other things, academicians had overlooked the victim as a worthy subject to study.

Academic materials and college courses in victimology, or the study of victims, simply did not exist in the mid-1960s. Today, library shelves contain a handsome collection of books dealing with a host of victimological issues. Mainstream journals routinely devote space to the study of victims and several specialty journals have emerged. Many college campuses now have courses that explore victim concerns, and some institutions even offer majors in victim services. Paralleling this academic development is the provision of direct services to victims. Victim advocates provide much needed assistance to help ameliorate the suffering that victims endure. Several states require service providers to complete specific training modules before they can become credentialed as victim advocates. In short, the victims' rights movement has achieved significant strides in a relatively short period of time.

The purpose of this entry is to introduce several key developments in the growth of victimology and victim services. The first portion is devoted to academic matters. There, we will visit the contributions that some of the early pioneers made and explain how the field began to take shape. Although prominent people made thoughtful contributions to the field, only a handful are presented here. The second part visits the victims' justice movement. It shows how grassroots efforts heightened public awareness of various social problems, molded the development of social services, and became an integral part of the landscape.

The Academic Portion

This section examines the contributions of selected academicians that gave rise to a focus on victims. Whereas many people were instrumental in steering this development, only a handful of those key actors can be highlighted here.

Hans von Hentig

One of the earliest forays into the study of crime victims came when the German scholar Hans von Hentig published the book *The Criminal and His Victim* in 1948. Transposing the preoccupation with criminals and the lack of emphasis on victims, von Hentig wondered what made people criminals.

Through this insightful move, von Hentig switched the issue to what made people victims. This simple, but brilliant, move spawned a whole new orientation.

The key ingredient, according to von Hentig's formulation, was the *criminal-victim dyad*. What was the symbiotic relationship between the criminal and his or her prey? von Hentig quickly came to the realization that not all victims were completely innocent of any wrongdoing. Sometimes, they took the role of an *agent provocateur*. In other words, they shared a certain degree of complicity with the offender. By naïvely subscribing to the labels of victim and criminal, it was easy for one to overlook the contribution victims had made to their own plights.

Although von Hentig emphasized the dynamics that underscored the criminal-victim dyad, he soon realized that not all victims were actively involved in their victimization. This awareness propelled von Hentig to develop a typology that focused on individual characteristics. Hence, von Hentig devised a series of categories that described typical victims. Some of his formulations included young persons, women, the elderly, immigrants, people with diminished mental capacities, wanton persons, and so forth. A common trait was that these people, for a variety of reasons, lacked the ability to mount a formidable defense to protect themselves. In other words, they were vulnerable specimens.

Unfortunately, von Hentig's work was not immediately accessible to American scholars. World War II blocked many scholarly interchanges between the United States and Europe. As a result, his ideas lacked circulation until a refugee found safe passage to America.

Stephen Schafer

Stephen Schafer was a university law professor in Hungary. When the Russian army invaded that country during the late 1950s, Schafer and his family feared for their safety and well-being. They fled Hungary right before the Communist "Iron Curtain" fell, separating the East from the West.

Schafer left all his books and papers behind when he immigrated to England. Already a speaker of multiple languages, Schafer eventually became fluent in English. He relocated to the United States where he held a brief faculty appointment at Florida State University and then at Ohio University

before settling into an academic position at Northeastern University. These experiences, coupled with his familiarity with von Hentig's work, helped mold Schafer's outlook.

Schafer penned a book, *The Victim and His Criminal*, in which he introduced American readers to von Hentig's formulations and expanded on those ideas. According to Schafer, the criminal-victim relationship is steeped in gradations surrounding the notion of "functional responsibility." Functional responsibility refers to the degree to which the victim contributed to the underlying dynamics of the episode. Functional responsibility can range from a complete lack of involvement, to partial triggering of an incident, to full immersion. Although he incorporated some of von Hentig's categories into his classification, Schafer also added a new grouping that he called "the political victim." Understandably, oppression because of one's political beliefs would become the subject of his next book.

Marvin E. Wolfgang

While he was a faculty member at the University of Pennsylvania, Marvin E. Wolfgang undertook, what was for those days, an immense empirical examination of homicide events. Wolfgang extracted information from the Philadelphia police case files for all deadly encounters that took place in that city from 1948 through 1952. Being one of the earliest empirical analyses in criminology, his 1958 book *Patterns in Criminal Homicide* attracted immediate widespread attention.

Like his predecessors, Wolfgang was interested in what role, if any, the victim played in causing his or her own demise. Consequently, he wanted to examine the notion of *victim precipitation*. In other words, how was the victim, if at all, responsible for the victimization episode? Wolfgang operationalized this concept by noting whether the victim instigated the event by displaying a weapon, throwing the first punch, or otherwise provoking the violent exchange. Altogether, 26% of the homicide cases in the Philadelphia files were determined to be victim precipitated when applying this referent.

Although primitive by today's standards, a subsequent statistical analysis set the tone for a fuller understanding of homicide. Three conditions quickly emerged from the data that remain true even today. First, many victims and offenders

knew each other prior to the lethal encounter. That finding contradicted the common perception that the typical homicide was a stranger-to-stranger occurrence. Second, more often than not, the death was the culmination of a series of steps that grew more aggressive. What started out as a minor matter escalated into a more heated confrontation and, ultimately, burst out of control. Third, alcohol consumption, by either or both parties, was a common denominator. However, it was not clear whether inebriated combatants were so belligerent that they rashly overstepped social boundaries or whether they were so impaired that they physically could not mount a suitable defense.

In any event, whereas earlier typologies were organized around the pivotal concept of victim precipitation, Wolfgang's research empirically grounded this concept for the first time. It seemed that victim precipitation might be just the portal for which victimologists had been searching.

Menachem Amir

Menachem Amir was a doctoral candidate at the University of Pennsylvania and conducted his dissertation research under the tutelage of Marvin Wolfgang. Amir adopted his mentor's methodology and extended Wolfgang's approach to understanding homicide by conducting a parallel analysis of forcible rape incidents. Amir accessed the Philadelphia police investigative records and gathered data for the 1958–1960 interval. When Amir published his dissertation in book format in 1971, he attempted to draw an explicit connection to Wolfgang's earlier work by titling his study *Patterns in Forcible Rape*.

Amir crafted his definition of victim precipitation after Wolfgang's lead. If the victim at first seemed to consent to an amorous liaison but then later withdrew her permission, the incident was deemed to be victim precipitated. Using dicey or risqué language, wearing provocative or revealing clothing, having a reputation as a "bad" woman, and other indecencies became indicators of victim instigation. In all, 19% of the rape cases came under the rubric of victim-precipitated incidents. Tracking Wolfgang's lead, victim consumption of alcohol was a major factor.

Amir alleged that some victims in his study had a psychological desire to be raped. This bald assertion

prompted considerable outrage and critics unleashed a barrage of angry criticisms. As a result of this hostile reception, many victimologists shied away from this entire line of research. If up until this point the field had relied heavily on the concept of victim precipitation, its future development was now in serious question.

Benjamin Mendelsohn

Some observers refer to Benjamin Mendelsohn as the “father of victimology.” Mendelsohn was a practicing attorney in Israel. During the mid-1950s, Mendelsohn used his case files to explore the topic of victim blame. Although he constructed a typology that built on von Hentig’s classification scheme, Mendelsohn made a much larger contribution when he coined the term “general victimology.”

As already noted, the developments associated with the idea of victim precipitation had led victimology down a blind alley. The schisms that formed in the aftermath of Amir’s book left the field fractured and disoriented. Questions arose as to whether victimology was merely a subarea of criminology or if it was a genuine discipline in its own right. And, there was the question of what was the proper scope of victimology. There was some concern that the field had exhausted itself and had been merely a passing fad. In short, a broader unifying scheme was needed.

A group of victimologists convened an international conference in Bellagio, Italy, during the summer of 1975. It was there that Mendelsohn unveiled his concept of “general victimology” in an effort to break new ground and to stake out a claim as to its intellectual legitimacy.

According to Mendelsohn, the overall purpose of victimology is to understand the causes of victimization, to devise appropriate prevention strategies, and to investigate effective remedies or healing options. To establish a more inclusive framework, Mendelsohn conceived of general victimology as consisting of five major categories of victims. His proposal included the following dimensions:

- Victims of crime
- Victims of oneself
- Victims of the social environment
- Victims of technology
- Victims of the natural environment

The first category, victims of crime, is self-explanatory. It refers to the typical subject matter that victimologists were pursuing already. The second grouping, self-victimization, encompasses the harm that individuals can cause themselves. Suicide would be a prime example of a pertinent topic in this vein. The third entry, victims of the social environment, examines inequities perpetuated by the social structure. Discrimination based on race, sex, or age would be a relevant concern. Genocide and war crimes would constitute additional examples. The fourth aspect embodies victims of technology. Although innovations generally improve the quality of life, they also carry latent, or unintended, consequences. Transportation improvements can spawn dire consequences, such as accidents, loss of life, and property destruction. Industrial pollution and the side effects associated with advances in medicine or surgical procedures would be additional examples. Finally, victims of the natural environment (flooding, monsoons, tornados, earthquakes, tsunamis, hurricanes, famine, drought, pestilence, and the like) constitute the last category.

No matter which victim category researchers concentrate on, they tend to pursue four core lines of inquiry. A primary focus is how the legal system and people define victims. The second element is the application of these definitions, by victims and by other actors, that captures additional interest. The third avenue deals with postvictimization reactions of sufferers and the needs that these persons typically exhibit. The last area incorporates the systematic responses that are in place for handling victims, their concerns, and the healing process.

Victimologists emerged from the Bellagio meeting with a renewed sense of purpose and greater clarity as to the direction in which the field was headed. However, this academic orientation in and of itself was not enough to sustain this fledgling discipline. It would take practitioners and their grassroots efforts to show how the application of this new body of knowledge was valuable.

The Grassroots Portion

This section examines the contributions that stemmed from direct service providers and legal reforms. These topics include victim compensation, the women’s movement, the children’s movement, national efforts to promote

victim services, and the potpourri of forces that propelled victim justice.

Victim Compensation Legislation

The practice of victim compensation made its formal appearance during the mid-1960s. New Zealand began such an initiative in 1963, and Great Britain debuted its program the following year. Spurred by the 1967 President's Commission, interest in victim compensation began to attract legislative attention in the United States. California was the first state to establish a program of this type. Today, all 50 states offer a victim compensation program.

Victim compensation and offender restitution are two related, but distinct, forms of remuneration. *Offender restitution* occurs when the offender reimburses the victim for damages incurred as a result of the victimization incident. *Victim compensation* is a slightly different method for channeling money to victims. Here it is the state, not the offender, who provides financial assistance to the injured party. Victim compensation is also reserved for violent crime victims.

Two different compelling arguments are presented for why the state should compensate crime victims. The first platform is the *social contract* position. The thinking here is that government is the exclusive provider of many services, particularly crime control and public safety. Citizens subsidize these activities by paying taxes. Whenever people are victimized through no fault of their own, government has failed to abide by its implicit agreement to serve and protect the citizenry. Hence, there is a moral responsibility to restore injured parties back to their previctimization status.

The second position emphasizes the *social welfare* responsibility of government. Government strives to ensure a minimum quality of life for disabled persons and other unfortunate members of society. Whenever people become victimized, they endure needless suffering and other deprivations. As a result, government should intervene and assist these downtrodden citizens.

Another thread connects the academic developments in victimology with victim services. Many compensation programs borrow a page from the victim-precipitation line of thinking presented earlier in this entry. Specifically, victims are not eligible for state reimbursement if they share culpability

for the crime. For example, the crook who is shot during a robbery attempt or somebody who instigates an altercation and becomes injured during the event are patently ineligible for a compensation payment. Thus, provocation typically renders one ineligible for compensation.

Many victim compensation programs contain other provisions regarding the victim-offender relationship. Specifically, they restrict eligibility to parties who are not related to each other, are not engaged in a sexual relationship, and do not live together in the same household. Of course, these rules placed situations involving intimate partner violence beyond consideration. As our understanding of the dynamics underlying domestic violence grew, lobbying efforts from the women's movement relaxed these restrictions whenever doing so would serve the best interests of justice.

The Women's Movement

The women's movement coalesced around two fronts during the 1960s and 1970s. The first concern addressed rape and sexual battery reforms. Rape reform advocates had identified a number of inequities in how rape laws were worded and how they were applied. The second area was spouse abuse and the system's response to this problem.

Today's standard of sexual battery or sexual assault has replaced the older offense of forcible rape. The common-law definition of rape consisted of carnal knowledge of a female by a male, who was not married to the victim, with force, and against the victim's will. Several considerations were made here. First, the sexist terminology defined women as the only possible victims and men as the only possible offenders. Second, the unlawful act was restricted to just vaginal intercourse and omitted other forms of degradation. Third, husbands were immune from prosecution. Fourth, the issue of physical force overlooked situations such as date rape. Finally, the presence of physical injuries played a critical role in determining lack of consent.

Reformers also lobbied for other statutory changes. First, rape was a capital punishment and carried a death sentence. Many juries were reluctant to convict unless the evidence was compelling. A severely injured victim was all too often the minimum threshold. Second, there was some indication that Black persons received harsher sentences

than White defendants, especially when the victim was of the opposite race (see, for example, the United States Supreme Court decision *Furman v. Georgia*, 408 U.S. 238 [1972]). Finally, some rape statutes required the victim be of “chaste character.” This stipulation invited the defense strategy of impugning the victim’s allegation by perusing past relationships in an effort to besmirch her reputation.

New legislation addressed these issues. In addition to recasting rape as the crime of sexual assault, the punishments were realigned so as to parallel existing aggravated battery provisions. Shield provisions were enacted to prevent overly intrusive expeditions that invaded victim privacy.

The second avenue involved spouse abuse. Advocates worked hard to make the public more aware of the sordid events that transpired between couples behind closed doors. Rather than portraying intimate violence as an anomaly, they showed it as an ordinary and routine cultural practice rooted in male domination. Lenore Walker’s portrayal of *learned helplessness* and the *cycle of violence* accomplished many things. For one thing, it demonstrated why spouse battering was an episodic occurrence. More important, it offered a rational response to the question of why battered women simply did not leave their abusers and walk away. Finally, it paved the way for “The Minneapolis Experiment” and the many reforms that came in its wake.

The Children’s Movement

Child abuse did not gain formal recognition until the mid-1960s. Although maltreatment certainly existed in those days, medical personnel could not recognize what they saw. Diagnostic breakthroughs by pediatric radiologists eventually led to the discovery of child abuse. In 1962, Dr. Henry Kempe unveiled a new phrase *the battered-child syndrome* to identify physical injuries inflicted on a child by a parent or caregiver.

Mounting recognition of child maltreatment as a serious problem prompted the passage of state laws during the 1970s condemning child abuse and child neglect. *Abuse* refers to the commission of an act on a child, whereas *neglect* pertains to the omission or withholding of food, clothing, shelter, or medical attention. These legislative efforts also relaxed the doctor–patient privileged relationship,

established mandatory reporting laws, provided a good faith exemption, expanded protective custody powers, and instituted central registers.

The campaign to combat child maltreatment acquired several tools in its arsenal. Under normal conditions, the doctor–patient relationship is a *privileged relationship*. In other words, what transpires between a doctor and the patient is private and confidential. Physicians are not allowed to disclose any information to outside parties without the patient’s prior approval. *Mandatory reporting laws* stipulate that members of certain professions have the legal obligation to notify the authorities of any instances of suspected child maltreatment. Doctors, nurses, dentists, and teachers are required to contact the police if they come across indications of abuse or neglect. State legislatures, in an attempt to promote widespread reporting, established the *good faith* standard. Should a person call the authorities about a possible child abuse situation and the ensuing investigation does not find substantiating evidence, the reporter cannot be sued as long as he or she made the report out of genuine concern for the child’s well-being and without any malice.

Protective custody occurs when a government agent removes a child from the home without the parent’s or guardian’s permission and without a court order. State statutes empower law enforcement officers and caseworkers to take immediate custody of a child who is in danger of abuse or neglect and transport that minor to a safe location. Any siblings present in the household who are thought to be in jeopardy can also be seized. A court hearing to determine whether this removal was a reasonable course of action will follow this action.

Another legislative innovation was the creation of a *central register* or a tracking system that housed information regarding allegations of child maltreatment. Emergency room physicians, social workers, and police officers could access these files to determine whether there have been prior instances of abuse involving the child, siblings, or family members.

Promoting Victim Services

The federal government, via its now-defunct Law Enforcement Assistance Administration (LEAA) arm, provided seed money to underwrite

the implementation of victim and witness assistance programs in local prosecutor offices. The goal was to fund fully fledgling programs in the first year and then provide decreasing amounts of money during the next 3 to 4 years. The idea was to get these activities up and running so they could prove themselves to the local community, become absorbed into the mainstream, and go on to become self-sufficient offices.

A second strategy was aimed at coalition building. Washington used grants to encourage the development of service-provider alliances within various states. It was during this time, for example, that the Florida Network of Victim/Witness Services was founded and became an incorporated entity. The goals of this organization were to advocate for victims, establish lines of communication between victim and witness service programs within the state, provide technical support to these programs, train service providers, and support legislative and educational initiatives. Similar bodies sprung up in various other states, creating a honeycomb.

The need for some type of overarching organization that spanned the states became quickly evident. The National Organization for Victim Assistance (NOVA), which was founded in 1975, intended to close this gap and provide a guiding light. The purpose of this group was to promote victim rights and services. Victim compensation, victim impact statements, victim rights amendments, the establishment of a victim rights week, the provision of training and support to victim advocates, and other concerns provided rallying points. Interestingly, although NOVA was originally founded with crime victims in mind, the organization has expanded its scope to include crisis response to victims of natural and technological disasters. Thinking back to the first part of this essay, this revamped orientation is in line with Mendelsohn's vision for a general victimology.

Other Developments

Many other allied developments drew attention to and kindled greater interest in victim issues. The National Opinion Research Center's foray into victimization surveys appeared in the 1967 President's Commission Report and paved the way for subsequent victimization surveys. A national program to conduct an ongoing series of victim surveys, an

effort that still continues today, came into being. President Reagan empanelled the Task Force on Victims of Crime and that body completed its work in 1982. A follow-up report by the Department of Justice in 1986 kept the spotlight centered on compliance with the Task Force's recommendations. The Minneapolis Experiment, which was reported in 1984, examined appropriate police practices when investigating spouse abuse, ignited a national debate, and spawned policy changes. The terms *posttraumatic stress disorder* and *battered woman's syndrome* gained acceptance in the legal and therapeutic lexicons. Passage of federal legislation, recognition of the problem of runaway children and missing persons, increased attention to the fear of crime among the elderly, a burgeoning incidence of homicide, school violence, sentencing reform, and a host of other concerns quickly captivated the attention of the American public. This sentiment became the foundation for a mounting wave of support for crime victims. As one can observe, the victims' justice movement helped usher in victimology as a valid and worthy enterprise.

Summary

Both the academic and the practitioner worlds have nurtured victimology throughout its embryonic stages. This mutually beneficial conflux has enabled a deeper understanding of the trials and tribulations that engulf victims and their loved ones in the pursuit of that elusive goal known as justice.

VICTIMOLOGY AND CRIME PREVENTION IN COMIC BOOKS

It has often been said that art imitates life, and today's popular culture and media is a reflection of that. In other words, popular media (cinema, television, radio, online publications, and print media) frequently reflects ideas and subjects taken directly from mainstream society. One of the more popular subjects for media focus is the criminal justice system. Studies have shown that movies, television shows, and numerous forms of print media often attempt to reflect both the actions and ideologies

of the criminal justice system and its members. One genre of popular media that is heavily based on the criminal justice system is comic books and graphic novels. Comic books and graphic novels often contain characters and/or storylines that emphasize themes of crime and justice, including victimization and crime prevention.

Definitions and Brief History

Comic books are typically short (e.g., 40 pages or fewer) paperback books or magazines that contain narratives, dialog, and artwork. They are often published as a series and printed on a monthly or bimonthly basis. Graphic novels are typically either extended versions of comic books—meaning they contain more pages than a typical comic book—or reprinted collections from a large series of comic books. They may contain independent storylines (e.g., *Watchmen*, *Sin City*, and *Wanted*) or reprints of short-run storylines from major comic book series (e.g., *Batman*, *Spider-Man*, *Hellboy*, and *Goon*).

Although made most famous with the introduction of superhero (e.g., *Superman*) storylines, comic books have been published for more than 150 years. Early in the 20th century, comic book writers began to focus heavily on themes of crime and justice, often developing series that reflected events from the headlines of the time (e.g., *Dick Tracy*, *Green Hornet*, and *Police Comics*). However, it was with the development and introduction of superhero comics (e.g., *Action Comics*, *Captain Marvel*, and *Detective Comics*) that the image of the comic book crime fighter was permanently instilled into mainstream society. These images and themes have penetrated even more into American society with the increased popularity of television shows (e.g., *Smallville*) and movies (e.g., *The Dark Knight* and *Superman Returns*) based on their comic book counterparts.

Themes of Crime and Justice

Most modern comic books focus on crime fighting as their central theme. Although in some instances it may be more evident or developed than in others, comic book heroes have their own unique philosophy, motivation, and brand of justice. After careful examination, examples of Herbert Packer's

conceptions of due process and crime control can be found throughout various comic series. However, crime control is undoubtedly the more dominant concept, with many characters adopting the mentality that the ends justify the means. Whether portrayed as the “All-American Hero,” the “Outspoken Tough Guy,” or the “Lone Vigilante,” nearly all comic heroes are driven to protect the innocent and stop the criminal.

Themes of Victimization

With few exceptions, the virtuosity and courage of comic heroes is reflected in the immoral and ruthless behavior of the villain(s). As a result, comic villains often perform extremely vile acts. Whereas property crimes (e.g., burglary and robbery) are sometimes committed, comic villains most often perform violent acts (e.g., murder and assault). In fact, the most popular comic villains (e.g., Lex Luthor and the Joker) are known for committing horrific and grotesque acts of violence—including mass murder, torture, and rape.

Most often, the victims of crime in comics are ordinary citizens who are in the wrong place at the wrong time. Paralleling reality, victims are frequently young males who are victimized during the course of their daily routine activities. Women and children are much less frequently portrayed as victims, typically used only to depict truly evil villains. In a small percentage of instances, small time offenders become victims of the more powerful villains. To extend the image of the evil villain, police officers and other criminal justice personnel are also frequent targets of victimization.

Themes of Crime Prevention

Crime prevention is often the underlying theme in most comic books. Even though the threat of victimization by the antagonists provides for the prospect of crime prevention, it is *prevention* itself in various forms that takes center stage. Crime prevention in comic books is portrayed in several ways—including preventing criminal acts, protecting the innocent, and even protecting criminals from other criminals.

Although investigative techniques are frequently illustrated, more often than not, a brute force intervention is used as the key means of crime prevention.

Focused almost exclusively on the ends, rather than the means, many comic heroes resort to use of force or violence to apprehend criminals. Frequently, this use of force is depicted as legitimate or justified given the situation; however, many times the protagonist uses excessive force or violence to prevent more serious crimes from occurring. Although a seemingly slanted view of crime prevention, this representation is similar to that often echoed by members of the general public.

Role in Criminology

Comic books and graphic novels, which are a neglected element in scholarly analyses of depictions of crime and justice in popular culture, often reflect societal conceptions of criminal justice. In fact, comics and graphic novels often serve as one of the initial representations of the criminal justice system for many children. This form of media has a long tradition of storytelling in which themes of victimization, crime prevention, and other criminal justice issues are depicted. As a result, its place in criminology should not be overlooked.

VICTIM PRECIPITATION

Researchers trying to understand criminal behavior have typically focused on the offender. With the advent of victimization surveys, however, attention turned to considering the role of the victim, and now, many scholars believe that no explanation of crime would be complete without a consideration of the victim's involvement. In 1958, Marvin Wolfgang began examining the relationship between victims and offenders in homicide incidents and introduced the term *victim precipitation* to reflect those incidents in which the victim played an active role in the outcome. The term *victim precipitation* has been defined and used in various ways since it was first introduced, and some of those definitions and applications have raised a great deal of controversy in terms of understanding and characterizing the victim's role. Although often criticized as victim blaming, the consideration of victim involvement in violence remains an important research direction.

Defining Victim Precipitation

As early as 1914, researchers were discussing the idea that some homicide victims may have provoked the attack that led to their own death. Victim provocation, which generally refers to a legal consideration of whether the victim overtly provoked the criminal act, is also a well-established concept in criminal law. The idea that victims might provoke their own victimization has legal implications for determining the offender's level of criminal responsibility or the appropriate sanction for a given offense. Establishing provocation from a legal stance typically involves considering the mind-set of the offender and his or her level of self-restraint. Commonly equated with a "heat of passion" defense, the legal concept of victim provocation suggests that offenders cannot control their actions because of a perceived slight by the victim. There is a clear focus on the offender's interpretation of the victim's behavior as provoking a justifiable response. A legal judgment that the victim somehow provoked the incident may provide some excuse or justification for the offender's behavior, resulting in charge or sentence reductions (e.g., conviction for manslaughter

rather than murder or receiving a more lenient sentence).

In his 1948 book, *The Criminal and His Victim*, Hans von Hentig commented that, although the final outcome may look one sided, many criminal incidents may be characterized by a mutuality of behavior or an interplay between the victim and offender that helps determine the final outcome. In other words, the victim may often be a primary causative factor in how a criminal incident unfolds. von Hentig criticized the legal concept of provocation as creating a false dichotomy between offender and victim that cannot deal with the complexity of most criminal incidents. He preferred a more relativistic framework for understanding the relationship between and roles of victim and offender in a given incident, and he identified a category of victims who actively provoked the crime. This early consideration of the relative involvement of victims and offenders paved the way for the development of victim precipitation as an area of research attention in victimology.

In contrast to the clear emphasis on the offender's level of self-control as a result of their subjective interpretation of the victim's behavior in the legal context of victim provocation, victim precipitation relies on a presumably objective analysis of the victim's behavior during the incident. The most well-known definition of victim precipitation was developed by Wolfgang in his seminal study of homicide conducted in the 1950s. Wolfgang argued that, in cases of victim precipitation, the homicide would not have occurred except for the active involvement of the victim. He goes on to specify that victim precipitation in homicide occurs when the victim (i.e., the deceased party) was the first to use physical force during the homicide incident. Other scholars have noted that this definition explicitly points to an active victim whose own willingness to resort to violence brings unintended lethal consequences back on himself or herself. Wolfgang also notes that whereas some cases of victim precipitation may also fulfill the legal requirements for provocation, resulting in reduced charges or sentences, it is not necessary for those legal requirements to be met to determine that victim precipitation has occurred.

Wolfgang provided several examples of homicide incidents from his own research that could be characterized as victim precipitated. In all of these incidents,

the individual who struck the first physical blow was also the one who was killed in the incident. For example, in one case cited in his research, the eventual homicide victim struck another individual several times before that individual retaliated, causing the victim to fall and hit his head, which resulted in his death. In his study of nearly 600 homicide incidents in Philadelphia, Wolfgang identified 26% as being victim precipitated.

Victim precipitation may be considered in conjunction with many existing theories of victimization, including lifestyle/opportunity theories and routine activities theory, which share a focus on exposure to risk as an explanatory factor. Victim precipitation research similarly argues that some individuals put themselves at increased risk of victimization by their own actions or words. The development of the concept demonstrated the importance of understanding victim involvement. During the years, this has come to mean both direct involvement of the victim (i.e., being the primary physical aggressor) and more indirect actions viewed as provoking victimization (e.g., engaging in risky behaviors and leaving property unprotected). With the inclusion of direct and indirect victim behaviors, developing a clear and objective definition of victim precipitation has proven to be a difficult task, especially when the concept is applied beyond homicide to other forms of violence.

Victim Precipitation in Violent Crime

Since the introduction of the term *victim precipitation*, researchers have used several different definitions ranging from narrow, legalistic criteria to extremely broad perceptual characteristics. At the narrowest end of the spectrum, victim precipitation has been considered to occur only in cases of self-defense. Like victim provocation, the determination of self-defense is often a legal one, in which violence may be justified when it is determined to be immediately necessary to protect one's self or others from imminent threat. As an affirmative legal defense accounting for victim precipitation, defendants have the burden of proof to demonstrate that self-defense has occurred. In contrast, broader definitions of victim precipitation are often disconnected from the legal criteria for provocation or self-defense, relying on a consideration of the actions of the victim and offender during a

given incident. Since Wolfgang's original study, researchers have continued to study the presence and characteristics of victim precipitation in homicide incidents and have also applied the concept to other forms of violence.

Defining victim precipitation is most clear in homicide incidents. Studies of criminal homicide have continued to measure victim precipitation by seeking to identify the primary physical aggressor during a given incident. Wolfgang found that more than one fourth of homicides in his study were victim precipitated, and he also presented evidence that victim-precipitated homicides were more likely among an offender and victim with some sort of interpersonal relationship and in situations where the offender was female and the victim (i.e., the deceased party) was male. Other scholars have replicated these results, finding similar rates of victim precipitation in homicide incidents and confirming gender differences in victim precipitation. Research generally concludes that male homicide victims are more likely than female victims to have precipitated their own victimization. In other words, male victims were more often the primary aggressor in the incident leading to their own death. Precipitation is also found to be more common when the victim was using alcohol or had a prior criminal record. Unfortunately, research examining precipitation in homicide incidents reports that there is often not enough information available to make a determination of whether precipitation occurred, resulting in a large proportion of cases classified as unknown.

Despite Wolfgang's specific focus on the victim's primary use of physical force as the determining factor in defining victim-precipitated homicides, subsequent researchers have expanded the definition and applied it to other types of violence. In cases of aggravated assault, victim precipitation has been similarly defined as occurring when the victim was the first to use physical force, but the definition also adds the use of provocative language or gestures on the part of the victim as precipitating factors. Studies using this definition have found that approximately 14% of aggravated assaults can be defined as victim precipitated. As with homicide, however, a determination of victim precipitation is unclear in more than half of the incidents examined.

The definition of *victim precipitation* in cases of robbery and rape is much broader. In robbery

incidents, victim precipitation has been defined as occurring when the victim did not take reasonable steps for self-protection. Studies have indicated that about 10% of robbery incidents are victim precipitated using this definition. Perhaps the broadest definition of victim precipitation has been used in studying rape. One of Wolfgang's students, Menachem Amir, attempted to apply the concept of victim precipitation to rape, defining precipitation as occurring when the victim agreed to sexual relations but changed her mind or did not react strongly enough when the suggestion was made by the offender(s). As part of this research, he defined a victim-precipitated rape as occurring when the victim dressed provocatively or had a "bad reputation." With this definition, he concluded that nearly 20% of rapes in his study were victim precipitated. Other studies have limited this definition to some extent, excluding considerations of provocative dress or reputation, and have reported a lower incidence of victim precipitation at about 4%.

As the application and definition of the concept have expanded, serious concerns have been raised about victim blaming. Amir's application of victim precipitation to rape cases, in particular, has been soundly criticized by numerous scholars and clearly equated with victim blaming because of his focus on the offender's interpretation of the victim's behavior and for insinuating that the victim was somehow responsible for his or her own victimization. Feminist scholars were particularly disturbed by Amir's conceptualization of victim precipitation, arguing that he was using rape myths (e.g., having a bad reputation or prior sexual behavior) to justify sexual assault.

Concerns about victim blaming remain a common problem in studies of victim precipitation. In the 1990s, it was suggested that victim precipitation was not well defined from the beginning and that later applications of the concept were problematic and politically untenable. These concerns have hampered the subsequent development of the concept. Scholars have argued, however, that the criticism of victim precipitation should not reflect problems with the concept itself but with how that concept has been measured and applied in some studies. These scholars have advocated for a more narrow and focused definition of the term to refer to those situations in which the victim's actions were a necessary part of the event. In other words,

but for the actions of the victim, the violent incident would not have occurred. Thus, defining precipitation in this way would require a return to Wolfgang's original definition involving the identification of the primary physical aggressor. In fact, researchers have suggested that the concept of victimization may be most applicable to homicide and assault but much less so in cases of robbery and especially rape.

Research on Gender and the Relationship Between Victim and Offender

Researchers have recently expanded on Wolfgang's initial work. His seminal study identified many factors related to victim precipitation, including gender and the relationship between victim and offender. In particular, Wolfgang found that male victims were more likely to have precipitated their own victimization and that homicides between family members or intimates were more likely to involve victim precipitation. These results have several implications for understanding the use of violence in intimate relationships. A recent study examining victim precipitation and intimate homicide examined whether victim precipitation was better accounted for by gender or the nature of the relationship between the parties. Using varying definitions of precipitation, including self-defense and the primary physical aggressor (i.e., the first to use physical violence or brandish a weapon), results found that incidents in which females kill males are much more likely to involve victim precipitation compared with those in which males kill females, regardless of the nature of their relationship. Referred to as a gender-differences model of victim precipitation, the researchers argued that victim-precipitated homicides are most likely when the offender is female because women are generally less violent than men and thus require more motivation (provided by victim precipitation) to commit homicide. As such, it is the gender of the offender and not the relationship between the two that is important.

More recently, this line of research was expanded to examine victim precipitation in nonlethal violence. Again using a definition of precipitation that identified the primary physical aggressor (i.e., the first to use or threaten physical force), research in this area has found that victim-precipitated assaults

were most likely to occur between nonstrangers and between males. Similar to the results with intimate homicide, there was no support for a gender-relationship interaction. Rather, victim-precipitated assault is best explained by a gender differences argument (i.e., incidents involving men are more often characterized by victim precipitation because men are generally more violent than women).

Research that has looked closely at intimate partner violence has generally found that women arrested for assaulting intimates frequently report that their partner had provoked the violence in some way or that they had acted in self-defense. These women intimate partner violence "offenders" seem to be indicating victim precipitation on the part of their "victims" (i.e., their male partners). On the one hand, studies have concluded that the male "victims" in these incidents are more likely to have precipitated their own victimization by initiating the physical violence. On the other hand, female victims are much less likely to initiate the violence in a given domestic assault incident. Thus, victim precipitation may provide new insight into the use of violence among intimates, especially in understanding and explaining differences in male and female use of violence in intimate relationships.

The Current State of Victim Precipitation Research

The existing victim precipitation research, although important in bringing attention to the role of victims, is plagued by several methodological problems. First, most studies do not incorporate statistical controls or multivariate statistics. Studies that rely on official data are hampered by the fact that in a significant portion of the cases, there was not sufficient detail to determine whether the incident was victim precipitated. As such, figures from these studies may grossly underrepresent or overrepresent the extent of victim precipitation. In addition, the reliance of official, police data results in the study of victim precipitation among cases known to the police. It is likely that victim precipitation is also related to the likelihood that a victim will report an incident to the police. If victims feel as if they share some responsibility, then they may be unlikely to involve criminal justice officials, resulting in the underrepresentation of victim-precipitated offenses among police records.

In addition to these concerns, the definition and measurement of the concept of victim precipitation remain problematic. Studies have used direct measures of the primary physical aggressor, but they have also incorporated indirect measures, like a prior history of violence or failure to take adequate precautions to avoid victimization. These indirect measures rest on questionable assumptions that have little bearing on the actual use of violence by the offender and victim in the specific incident being examined. In addition, the use of indirect measures clouds the presumed objectivity of determining whether victim precipitation occurred and raises serious concerns about victim blaming. Because of the amount of criticism that the concept of victim precipitation has received, it is important to clarify the term and to distinguish it from provocation and victim blaming.

With the difficulty in defining and measuring victim precipitation, scholars argue that the phenomenon remains an idea rather than a scientific concept or theory. Future work in this area should try to provide a clear and objective definition that would allow the concept of victim precipitation to be objectively applied and integrated into existing theories of victimization. One step in this direction would be to distinguish the direct and active behavior of the victim (i.e., the initiation of physical violence) from more indirect measures that might better be classified as facilitating (e.g., involvement in risky behaviors). In this way, the concept of victim precipitation allows the researcher to take into consideration situational and contextual factors, providing a richer, more thorough explanation of the criminal event. An inclusion of situational factors into any analysis examining violent incidents should include what active role, if any, the victim played in the evolution of the incident.

VICTIM SERVICE PROVIDERS, TRAINING OF

The provision of services for crime victims is an integral component of the criminal justice system and is woven throughout networks of community-based providers. Victim services derive from multiple disciplines, including, although not limited to criminal justice, law, social work, psychology, and public health. Included in these services are a range of government, nonprofit, and private stakeholders who work in diverse settings. The training of victim service providers has evolved over time to meet the ever-changing manifestations of victimization. In recent years, victim service providers have made significant efforts at standardizing training procedures and outcomes for their employees. These efforts have been bolstered through federally funded initiatives such as

the U.S. Department of Justice's National Victim Assistance Academy, state victim assistance academies, and the National Victim Assistance Standards Consortium. Such efforts have advanced professionalization within the developing field of victim services beyond piecemeal training to include (1) development of professional standards and (2) comprehensive credentialing programs.

The Formalization of Professional Standards

Early efforts to provide victim services placed a strong emphasis on the experiences of victims of violence coupled with grassroots advocacy. Over time, the efficacy of service responses sometimes encountered challenges because of the divergent perspectives of the field's multiple stakeholders. Professional development specific to victim services was advanced through conference-based workshops, such as those offered through the National Organization of Victim Assistance, the National Coalition Against Domestic Violence, and the National Center for Victims of Crime (formerly the National Victim Center). Working partnerships were also formed through organizations such as the state and national coalitions against domestic violence and sexual assault, state law enforcement advocacy and prosecution advocacy organizations, the National Association of Crime Victim Compensation Boards, Mothers Against Drunk Driving, Parents of Murdered Children, and the National Organization for Victim Assistance. The structure of these trainings and partnerships developed into more comprehensive models of practice, with multiple training tracks to address the content needs of providers working in varied settings. Professional standards have now become a key aspect of competency-based training as well as academic certificate and degree programs.

Credentialing

A credential is a formal designation given to an individual who has satisfied a set of standards and/or who has demonstrated a level of competency to an authority. Cyril Houle (1980) states that credentialing is a necessary component of any professionalized system. Houle cites the formalization of policing, legal, and educational work groups as examples of this process. To date, credentialing

has been an issue of controversy in the victim services field because few victim assistance providers are currently required to subscribe to a formal code or national set of standards. Several state and nonprofit initiatives have paved the way in the credentialing of victim services providers. For example, the Ohio Advocate Network, which is a multidisciplinary group that includes both public and nonprofit providers, has developed an application-based system that incorporates multiple tiers of credentialing. Having satisfied hourly requirements for base training and continuing education, a victim service provider can earn credentials that include Registered Advocate, Registered Advocate with Advanced Standing, and Registered Advocate with Senior Standing. Some state-based credentialing programs now require public providers to receive training as a contingency for receipt of government monies, either through agency funding or through Victims of Crime Act grant awards (e.g., Florida, California, and Pennsylvania). The state of South Carolina became the first state in the nation to mandate certification and basic training requirements for both government and nonprofit victim service providers.

Because the provision of victim services involves the collaboration of diverse agencies and programs, there has been a strong need for standards to guide provision of victim services. The U.S. Department of Justice funded the National Victim Assistance Standards Consortium to draft model standards that could be adapted to varied victim service settings. These standards were conceptualized via a tripartite scheme including program standards, competency standards, and ethical standards. Program standards are typically used by coalitions, umbrella agencies, and national organizations to regulate the administration of services. Competency standards outline attitudes, knowledge, and skills for individual victim assistance providers and may be used as the basis of learning objectives for training curriculum development. Ethical standards include rules of conduct and values for principled decision making. This typically includes a code of conduct that, according to Houle, formalizes "a broad summary of the moral behavior that is expected of every practitioner and that becomes a guiding though constantly reinterpreted tradition, somewhat like the American Bill of Rights" (pp. 65–66). In some cases, victim service providers

may be required to take an oath to abide by these standards. Ethical standards are frequently used in training, in credentialing programs, and by membership organizations.

According to the Office for Victims of Crime, the field of victim services has moved from a fragmented, primarily advocacy-centered approach response to victimization toward "a full-fledged advocacy and service field dedicated to meeting the physical, financial, and psychological needs of victims and their families" (p. 153). The training of victim-service practitioners has been professionalized through the development of standards as well as comprehensive credentialing programs.

VICTIMS OF POLICE USE OF DEADLY FORCE

Several hundred people die each year in the United States as a result of police interventions. Most of these are lawful uses of deadly force against dangerous criminal suspects. Some are provoked by mentally disturbed or distraught individuals wanting to die, which is known as a suicide-by-cop scenario. Some deaths are unfortunate mistakes of judgment. Others are genuine accidents. Fewer still are criminal abuses of the use-of-force privilege given to the police. Even those killed or injured by police in lawful and justifiable circumstances can be viewed as victims of police use of deadly force.

Some justifiable homicides are *suicide-by-cop* cases. In the 1993 film, *Falling Down*, Michael Douglas plays the role of an out-of-work, aggravated man who brings his life to an end in a suicide-by-cop scenario. Prior to this film, such cases rarely were mentioned but did occur. Now police agencies routinely conduct training to deal with it.

Mistakes in judgment are wrongful death cases and often result in civil lawsuits for damages but rarely in criminal charges against the police. In 1999, Amadou Diallo was mistaken for a rape suspect and fired on 41 times and hit 19 times by four New York City police officers. The officers reported that Diallo was reaching into his clothing for something they wrongfully assumed was a gun. It was just his wallet. In 2001, police officer Willie Wilkins, who was undercover in Oakland, California, was holding his firearm on a suspect while making an arrest, and he was observed by two uniformed officers who misinterpreted the situation and fired on Wilkins, killing him. Such tragic events are mistakes, and the large civil judgments awarded to their families, as in the case of *Wilkins v. City of Oakland* (2004), pursued by the law firm of Haddad and Sherwin, reflect our judicial system's anguish over such events.

An *accidental injury* can occur whenever a police officer unintentionally discharges a weapon and hits someone not involved in a criminal activity. The victim may even be a fellow officer injured in an accidental discharge of a weapon in

police training, as Kimberly Lonsway and Susan Welch report, or normal police operations, as discussed by Stuart Meyers. To minimize risks to "innocent by-standers" police are taught not to use warning shots or fire into the air (what goes up must come down), and not to fire on suspects in the vicinity of others. The victims of such injuries are entitled to receive civil damage awards and such cases usually are settled with minimal litigation or publicity.

More rarely, a police officer *criminally abuses the use-of-force privilege* given to the police. In these cases, the police officer may hope to escape criminal prosecution by disguising his or her criminal act under the guise of a lawful use of deadly force or may simply attempt to evade detection for the crime. Some of these homicides begin as line-of-duty actions that go horribly wrong but go beyond simple mistakes of judgment.

It has been asserted that many killings of minorities are, as Stuart Palmer once claimed, willful police targeting of young, innocent African Americans. Although it is true that African Americans are disproportionately more often killed by police, comprising about 30% to 32% of those killed in encounters with law enforcement, as Christopher Mumola documents, they are also disproportionately more involved in violent crimes, which is a factor in police-suspect confrontations. In Federal Bureau of Investigation (FBI) statistics for 2006, minorities comprised 48.6% of those arrested for criminal homicides and 56.3% of those arrested for robberies, so many shootings are justified.

Some documented cases involve criminal activity by police, but as Jodi Brown and Patrick Langan have argued, it is difficult to determine how many criminal acts by police officers actually occur. The current data sources do not distinguish the occupation of "police officer" among all of those suspected of or charged with criminal homicides.

The loss of any life, even that of a violent criminal suspect, is a tragic event to someone. Even if death does not follow from the use of deadly force and the victim survives the injury, the harm done often is substantial. Ethical police practice demands that a police officer seek less than deadly options whenever possible and resort to deadly force only when those other options are not available. The police arrest about 600,000 violent offenders

annually, slaying 373 in an average year, which equals less than one tenth of 1%, which suggests that most police find nonlethal means of arresting most violent offenders most of the time.

VICTIMS' RIGHTS LEGISLATION, FEDERAL, UNITED STATES

In 1981, Ronald Reagan created the President's Task Force on Victims of Crime. This task force was designed to bring national recognition to the status of victims of crime and a national focus on victims' rights and service expansions. Its final report included 68 recommendations that became the impetus for the creation, implementation, and advancement of new federal legislation. The major initiatives that address federal victims' rights legislation are outlined as follows.

The Federal Victim Witness Protection Act (1982) instructed the Attorney General to create and implement guidelines for officials to follow when responding to the needs of victims and witnesses. The goal of the act was to ensure that the victims of federal crime were treated with fairness and respect for the victim's and/or witness's dignity and privacy.

The Victims of Crime Act (1984) provided funds to assist state programs that monetarily compensate the victims of crimes (established the Crime Victims Fund). The funds are gathered through fines and assets seized from offenders who have been convicted of breaking a federal law. The funds are then disbursed to eligible victim-compensation programs or given directly to the governor of a state for distribution to victim-compensation programs. This act also established the federal Office for Victims of Crime, which is a division of the government that oversees victim-compensation programs.

The Crime Control Act (1990) provided a federal bill of rights for victims of a federal crime and directed the U.S. Sentencing Commission to change sentencing guidelines. The act mandated that \$900 million be provided to states to help assist in improving their criminal justice systems, build effective prison systems, and provide alternatives to incarceration. It also expanded grant programs that focus on victims of child abuse and significantly increased penalties for child pornography convictions.

The Child Victims' Bill of Rights (1990) provided child victims and witnesses numerous rights that had not previously been extended to them. It includes the right for a child to have proceedings explained in language they can understand; a victims advocate present at interviews, hearings, and trials; a secure

waiting place during trial; a support person to wait with prior to hearing; personal information kept private unless otherwise specified by the child or guardian; an advocate who informs the court about their ability to understand the proceedings; to be provided with information and referrals to agencies for assistance; and an advocate present in court for emotional support and to allow law enforcement agencies to have other services available (child protective services, victim advocates, and staff with specialized training).

The Victims' Rights and Restitution Act (1990) confirmed that victims have a right to compensation and use of federal services that offer help to victims. The Victims' Rights and Restitution Act created a federal Bill of Rights for federal crime victims, which include the following rights:

- Be reasonably protected from the accused
- Reasonable, accurate, and timely notice of any public proceeding involving the crime
- Reasonable, accurate, and timely notice of any release or escape of the accused
- Not to be excluded from any such public proceeding
- Be reasonably heard at any public proceeding involving release, plea, or sentencing
- Confer with the attorney for the government in the case
- Full and timely restitution as provided in law
- Proceedings free from unreasonable delay
- Be treated with fairness and with respect for the victim's dignity and privacy

The Violent Crime Control and Law Enforcement Act (1994) is a comprehensive package of victims' rights that included: implementing the Violence Against Women Act (authorized more than \$1 billion in funding for programs to address violence against women) increased the Victim of Crime Acts programs, funding, and provisions, and established a National Child Sex Offender Registry and augmented punishment and sentencing for those driving under the influence with children as passengers.

The Antiterrorism and Effective Death Penalty Act (1996) provided \$1 million to strengthen anti-terrorism efforts and mandatory restitution in federal violent crime cases and expanded compensation and victim services for victims of terrorism (includes victims in the military and abroad).

The Victims' Rights Clarification Act (1997) extended the rights of victims of crime to attend the trial of the offender and provide impact statements during sentencing. The bill clarified preexisting law so that judges and district courts cannot deny victims and surviving family members the ability to witness the trial, even if they plan on providing impact statements during the sentencing phase. This act extended current law to include capital cases and noncapital cases.

The Victim Restitution Enforcement Act (1999) established formal procedures for the courts to determine victims' losses, required that restitution be provided to the victim regardless of the offenders' socioeconomic status, and allowed the courts to enter a restraining order or property injunction against the offender if necessary.

The Violence Against Women Act (2000) authorized \$80 million annually for rape prevention and education grants, expanded federal stalking statutes to include stalking that occurs over the Internet, and authorized funds for battered women's shelters, transitional housing for female victims of violence, and funds to investigate and address violence against women with disabilities.

Justice for All Act (2004) provided \$155 million in funding for federal and state victim assistance programs. It focused on the substantive rights for crime victims and the means of enforcing them. The act also provided funds to test the backlog of rape kits, allows for improvements within the nation's crime labs, and helps offset the costs of DNA testing of offenders.

VICTIMS' RIGHTS LEGISLATION, INTERNATIONAL

The role of victims in criminal prosecution has changed drastically over time. Historically, the development of victims' rights in European countries followed a similar pattern to that found in North America. For centuries, the role of the victim in criminal prosecution was essential, as the state had little if no involvement. This golden age of the victim lasted into medieval times, when all wrongdoing was considered private. Then, by the 14th century, the victim was no longer the center of attention and compensation was not considered a purpose of the criminal justice system, until it reemerged in the 19th century.

Internationally, victims' rights have gradually become a preoccupation for the community as well as the criminal justice system since the mid-1970s, although a couple of initiatives can be traced back to the early 1960s. Over time, most Western jurisdictions have instituted different victims' rights and developed a wide range of services for crime victims. Beyond the diversity of contexts, there is constancy in the efforts to develop victims' support agencies and implement victims' rights. Most victims' rights models encompass compensation schemes, victim assistance programs, and regulations on victims' rights. Rights pertain to, for example, receiving information about the status of the case and applying for financial aid and psychological counseling. Nevertheless, whereas service rights have been widely accepted, the right to participate actively in the judicial process has proved a highly controversial issue, as some argue that procedural rights threaten a defendant's due process rights and undermine fairness.

Although victims' rights reforms around the world have been remarkably uniform, it is not possible here to discuss the specifics of each country. Therefore,

after briefly presenting supranational legislations, the European experience will be chosen as the focus of this entry, especially with regard to its characteristics that differ from the Anglo-Saxon model(s).

Supranational Legal Texts and Recommendations

Victims' rights reforms have been mostly similar across countries because they were inputted by the 1985 *United Nations Declaration of Basic Principles of Justice for Victims of Crime and Abuse of Power*. The declaration defined the concept of crime victims, commanded access to justice and fair treatment for all victims, and dedicated a special attention to victims of abuse of power.

In Europe, additional uniformity was achieved with the adoption of one convention and two recommendations issued by the Council of Europe. The *European Convention on the Compensation of Victims of Violent Crime* (1983) established basic principles, among which the obligation of the states to compensate crime victims whenever compensation is not fully provided by alternative sources. Two years later, the *Recommendation R(85) 11 on the Position of the Victim in the Framework of Criminal Law and Procedure* was issued, which provided countries with a list of suggestions to be implemented at different levels of the criminal justice process, from the police station to the court. Then, in 1987, the *Recommendation R(87) 21 on the Assistance to Victims and the Prevention of Victimization* was adopted and addressed, among other issues, the importance of assessing level of victimization and victims' needs to adequately design victim assistance programs and services. Although legal texts recognize some regional variation in the implementation and structuration of programs, for the most part they suggest the establishment of fairly uniform practices across countries. Before the input of the Council of Europe, only three European countries, namely, the United Kingdom, Germany, and the Netherlands, had legislated on victims' rights.

More recently, in 2001, the *European Union Framework Decision on the Standing of the Victims in Criminal Proceedings* was passed, establishing minimum standards for the treatment of crime victims. Since March 2002, this set of

principles is legally binding for European Union Member States, which consists of 27 countries in 2009. Themes refer, for example, to the possibility for victims to be heard during proceedings and to supply evidence, as well as to the right to access advice provided free of charge.

Major Differences Between Europe and the United States

Adversarial and Inquisitorial Models of Criminal Procedure

The place of the victim in the criminal justice system seems to depend on the evolution of the philosophy of penal repression. Because of historically and philosophically different traditions, two types of procedures coexist within the criminal justice framework: the adversarial model and the inquisitorial model.

The adversarial model favors the role of the different parties; the trial is conceptualized as a contradictory, oral, and mostly public dispute between the prosecution and the defense. Each party needs to provide evidence for his or her case. The role of the judge is to arbitrate the case, rather than conduct the investigation. The adversarial model exists in diverse forms in North America, Japan, and some European countries. On the contrary, in the inquisitorial model, the judge represents the interests of the community, as each offense is considered a breach of the peace. The judge is a legally trained professional in charge of conducting the investigation; therefore, he possesses important powers and orders acts of investigation both against and in defense of the accused. The investigation is written and secret, whereas the audience is public and contradictory. The inquisitorial procedure still appears to be the rule in continental Europe; yet the emblematic figure of the investigating judge is declining both in fact and in law.

The adversarial and inquisitorial models of criminal procedure do not consider victims alike. Although some countries view the victim as a party with his or her own rights, others view the consideration of victim as a duty of the criminal authorities. In addition to laws ensuring victim notification, protection, and financial compensation, most European legislations, with the exception of the United Kingdom, have granted victims with different mechanisms for influencing the course of

criminal proceedings. Participatory rights exist throughout the process and also pertain to hearings on bail or pretrial release of the offender to posttrial release hearing.

Traditionally, the common-law or adversarial system does not recognize the victim. The victim serves only as the principal witness for the prosecution. Unlike continental legal systems, the adversarial system usually accords victims no formal standing in the prosecution of their offenders. Yet, over time, there has been a demand for procedural rights within adversarial procedure, as illustrated by the implementation of victim impact statements in the United States and, recently, in the United Kingdom.

Victim Participation: A Controversial Issue

The issue of victim participation pertains to a balance between prosecution, defense, and victims' rights. Therefore, the degree to which a victim can input into or participate in criminal proceedings has for long been controversial. Arguments against victim participation include, for example, the intrusion of private says into public decision-making, the limitation of prosecutorial discretion, or the risk that the victims' subjectivity undermines the court's objectivity.

With respect to the victim's position in the trial, countries can be divided in three general groups. In countries from the first group (roughly speaking Northern and Eastern Europe), the victim has traditionally had the right to participate in prosecution. The second group consists of countries that have a French-based criminal code and that allow the victim to be a *partie civile* in the criminal process. The third group consists of common-law countries where the role of the victim has historically been limited to that of a witness.

In continental European legislations, the right to provide the court with input and, in some case, the right to control the course of the proceedings has been instituted. Obviously, no country allows the victim a direct say over the sentence, which always remains the absolute prerogative of the court; however, the scope of involvement differs depending on the option chosen. Some aspects of victim participation are reviewed hereafter and, as will be observed, the European experiences with victims' participation have been different from the Anglo-Saxon model.

Figures of Private Prosecution

Many legal systems offer alternatives to prosecutorial discretion. Most common methods include the institution of mandatory prosecution under defined circumstances, the existence of judicial review for prosecutor's disposal, and the right to private prosecution. The general right to prosecute is a historical heritage that has been considerably restricted in law and in practice; however, it is still effective in some jurisdictions. For example, in Spanish criminal procedure, any citizen can file a complaint and act as formal accuser. In England and Wales, although a marginal right, any victim can instigate a private prosecution by making a formal complaint to the magistrates' court, as long as he or she can support the costs of prosecution. In Germany, private prosecution is limited to specific offenses, for example, trespassing, defamation, vandalism, and comparable offenses; in such cases, private prosecution is authorized only if settlement has failed. In other continental systems (Austria, Norway, and Sweden, for example), the right to private prosecution exists as a secondary right, that is, when the public prosecutor refuses to bring charges or when he drops the case. Then, in a couple of legislations, some offenses are prosecuted only at the request of the victim; these are called complainant offenses and exist in, for example, Austria, France, Germany, Norway, Switzerland, Spain, and the Netherlands.

Even though most European systems employ at least one method to limit prosecutorial discretion, the figure of private prosecution does not play a significant role in practice. This is hardly surprising considering the burden that would represent for an individual, to collect and present evidence in court.

Adhesion Procedure and Civil Party

Countries with a civil legal tradition provide crime victims with formal rights in the criminal justice process, most often around the *adhesion procedure* or *civil party*. As a civil party, the victim can attach his or her civil claim to the criminal prosecution and thus participate as a party with legal representation. Yet the adhesion procedure is not only about compensation as it entitles victims to several active procedural rights, such as the right to be heard in court, to propose and submit evidence, to comment on any evidence submitted, or

to cross-examine. Joining a civil claim to criminal proceedings has many advantages, such as lower costs and the speediness of the procedure. Most of all, it offers the victim the possibility to express his or her views, while leaving the burden of prosecution and evidence to the public prosecutor.

Compensation

Traditionally, the victims' rights movements have sought empowerment, i.e., the possibility to input major decisions at every stage of the criminal justice process. Yet another strand of the victims' movement is state compensation for crime victims. Governments have always been keen to show that they care for crime victims. In this context, state-administered compensation programs are attractive because they profit the most visible victims (i.e., violent crime victims) and because they are not dependent on the action of a third party.

The first compensation scheme in Europe was the *Criminal Compensation Board*, which was set up as an administrative board in the United Kingdom in 1964, 1 year after the first compensation scheme was instituted in New Zealand. During the late 1960s and early 1970s, compensation schemes were introduced in several states in the United States, Canada, and North European countries. Today, almost every country runs a compensation program, following in the tradition of the Council of Europe and United Nations. A specificity worth mention: The case of English compensation orders that are, in contrast to many other countries, criminal sanctions made by the court of its own order; compensation orders have priority over fines, but can only be ordered if the defendant is found guilty.

Patterns of Change

Although some legal commentators consider victim participation a threat to the core values of the adversarial model and a challenge to the established patterns within criminal courts, most victims' rights activists consider it a positive evolution. Advocates argued that in addition to helping victims recover and increasing their satisfaction as well as cooperation, participatory rights promote more informed, hence accurate, sentencing. In common-law countries, criminal justice authorities generally welcome victim impact statements but are often reluctant to

allow these statements to influence the sentencing process. In most European legislations, crime victims can, and on occasion do, participate in criminal trials; yet there is no evidence that their involvement has negative consequences on the progress of criminal procedures. The debate continues.

Legal reforms may be a prerequisite for substantive change, but the ultimate test is whether victims receive the benefits of the reforms. Victims have varied interests in turning to the criminal justice system; therefore, the availability of different options can be regarded overall as beneficial for the victims. Yet, new developments always increase the need for researchers and policy makers to assess the true impact of reforms.

VICTIMS' RIGHTS MOVEMENT, INTERNATIONAL

Although diverse international initiatives have led to more standardized practices across countries,

adopting a global perspective on the victims' movement is still a stretch as there might be more than one victims' movement. Because of varying legal, social, and cultural contexts and traditions, victims' movements grew apart in different countries. Even though most countries agreed on the need and importance to take care of crime victims, responses have varied considerably.

Opposing victims' movements both in the United States and in Europe will serve as framework for this entry. Clearly, countries outside Europe like Australia or New Zealand also underwent interesting transformations and developments that do not exactly fit into either the North American or the European model. Unfortunately, it is not possible to discuss the specifics of each country; therefore, this entry resorts to general features and trends.

The Origins of Victims' Rights Movement(s) Around the World

Internationally, victims' movements have gradually gained visibility and recognition since the mid-1970s, although a couple of initiatives can be traced back to the early 1960s. Organized victims' rights movements began to appear in the United States, the United Kingdom, Australia, Canada, and New Zealand between the late 1970s and early 1980s. In most European countries, victims' movements were at their best from 1985 onward, because many international initiatives were passed in the area of victims' services and victims' rights, including one convention and two recommendations from the Council of Europe, and the 1985 *United Nations Declaration of Basic Principles of Justice for Victims of Crime and Abuse of Power*.

The growing interest for victims' rights was triggered by different factors. First, public reactions in view of rising crime rates made victims' rights, as well as fear of crime, politicized issues in many countries. People were getting tired of the extremely impersonal and ineffective nature of the criminal justice system. At the same time, the feminist movement was putting a strong emphasis on the needs of women and children as victims of interpersonal violence. Professionals were more aware of the impact of crime on individuals, including both short-term and long-term consequences. Some commentators also questioned the rehabilitative model as a response

to offending and the emergence of center-right in British and North American politics.

The Specifics of the Victims' Movement(s) in Europe

From the early 1970s onward, victims' advocates and activists in the United States have aggressively campaigned for victims, focusing mainly on the idea that victims have *rights* and should therefore *claim* these rights. Campaigns also include calls for harsher sentences and, in a way, the rights of the victim were often claimed at the expense of the rights of the offender. On the contrary, in Europe, influential voluntary organizations were more invested in improving victims' services than fighting for radical changes in legislation. However, this categorization is not clear cut: Many agencies in the United States are purely service oriented, whereas different activist groups across Europe are fighting for victims' rights and tougher sentencing.

Over time, many developments have emerged in the area of victims' rights and services around the world, many of these under the impulsion of victims' movements. Across Europe, many voluntary groups or agencies began to provide crime victims with psychological counseling, support, advocacy, and legal advice, especially in the area of claims or actions for compensation. The *National Association for Victims Support Schemes* in the United Kingdom provided a framework for the support of victims in many countries, notably Ireland, France, Sweden, and the Netherlands. Specialized agencies in the area of sexual and domestic violence were set up by feminists around the world and played a key role in advocating the specific needs of women as victims of rape or domestic abuse.

Institutionalization and Professionalization

By and large, victims' support agencies underwent a rapid process of institutionalization and professionalization in the 1980s. Because of competition for state funding, agencies were likely to transform into bureaucratic organizations with standardized practices, victimization records, and specialized training. Individuals involved in victims' services changed too, from passionate activists to professionally trained counselors. Although, in the past, volunteers were likely to deal with victims of

burglary, they were suddenly asked to support rape victims and assist families of murder victims. Long-term support and a more professional approach to victims became the norm, modifying local assistance schemes. Because the ideological background of victims' movements was not always identical in each country, some agencies kept a distance from official agencies, whereas others were keen to be obtain funds through official channels. These issues were particularly salient in some countries, notably in the United Kingdom, in part because of the voluntary tradition of victims' services. Yet a similar debate arose in Germany (i.e., West Germany at that time) and the Netherlands.

Another major trend of this period is the focus on the original criticism of secondary victimization, many countries worked at strengthening the position of the victim. Learning from the experience of other countries, France, and later the Scandinavian countries, achieved a professionalization of victims' support agencies built on a good balance among institutionalization, generalized services, and voluntary work.

Learning From Each Other

Victim issues are still topical in almost every country; yet it is difficult to predict what will be the next step. European countries are not only looking at North American innovations but also at what is being implemented in their neighboring countries. Although the evolution and priorities of victims' movements across Europe were not identical to the American model, all these movements share the same concern for the victims' needs and well-being. Thus, the future might help us in answering our initial questioning: *Are there one or several victims' rights movements?*

VICTIMS' RIGHTS MOVEMENT, UNITED STATES

The crime victims' rights movement in the United States is founded on the idea that the criminal justice system went horribly awry when it moved away from its victim-centric origins, creating an exclusively two-party system and treating individual victims as interlopers. During the past 40 years, the movement has worked to overcome this perceived flaw in the system by passing state, federal, and local legislation in an attempt to reintegrate the individual victim as a legally recognized participant with rights, interests, and voice into the criminal justice process. This entry explores the movement's attempt to reintegrate victims legally, discussing the history of victims' rights, the state of rights today, and identifying common areas of contention regarding victims' rights. This entry does not address the equally important aspect of the victim movement aimed at creating and affording victim services that aid victim recovery and survivorship.

History of Victims' Rights

Early History of Rights and the Initial Move to Exclude Victims

At the founding of the United States, the criminal justice system was victim centric in that crimes were often investigated and prosecuted solely by the individuals victimized. This shifted, however, to a recognition that harm from crime is, in part, a social harm, and the criminal justice system should be a tool aimed at remedying this harm rather than providing an avenue to redress

personal harm. The rise of the office of public prosecutor, the establishment of a professional police force, and correctional reform resulted in a fundamental shift in the criminal justice system. The individual victim came to be viewed as a witness to, or piece of evidence in, the case against the accused, and notions of individual harm were largely deemed inappropriate for the system's consideration.

The Rise of the Modern Victims' Rights Movement

In the late 1960s and early 1970s, three social justice movements were focused on the inability of the criminal justice system to take account of and treat fairly the individual harmed by crime. The "law and order" movement was rejecting the criminal justice system's perceived exclusive focus on the rights of the defendant; the civil rights movement was fighting disparate treatment of racial minorities, including the inability of victims of racial violence to secure effective prosecution; and the feminist movement was organizing shelters, services, and legal responses to remedy the system's poor treatment of victims of sexual and domestic violence. These groups became the foundation for the modern crime victims' rights movement.

Beginning in the 1970s, the movement coalesced and successfully passed legislation designed to alter the victim-exclusion model, including laws providing for victim compensation and erecting rape shield protections. These early efforts were largely isolated attempts to alter the system through targeted legislation and creation of victim services. In 1982, the President's Task Force on Victims of Crime held public hearings throughout the United States and concluded that with the exclusion and poor treatment of victims the criminal justice system had "lost the balance that had been the cornerstone of its wisdom" (p. 16). The Final Report of the Task Force set forth 68 recommendations for improving treatment of crime victims, including a proposal to amend the Sixth Amendment to the United States Constitution to ensure "the victim, in every criminal prosecution shall have the right to be present and to be heard at all critical stages of judicial proceedings" (p. 114).

Victims' Rights Today: The Re-Emergence of Victim Participation

The movement took the recommendations of the Task Force to heart, turning national and cohesive attention to amending the U.S. Constitution and promoting state constitutional and statutory changes to afford rights to victims. Since 1982, more than 30 states have amended their constitutions to afford victims rights in the criminal justice process, and all states have passed statutes affording such rights. Even though these provisions vary greatly in the number of rights afforded, the timing of when such rights attach, and the enforceability of the rights, they are generally aimed at enhancing victim privacy, protection, and participation.

Efforts to amend the federal constitution began in earnest in 1996 with introduction of an amendment in the United States Senate, and these efforts have continued in nearly every Congress since. Efforts at the federal level also included statutory reform. For instance, in 1984, the Victims of Crime Act passed and the Violence Against Women Act passed. In 2004, the Scott Campbell, Stephanie Roper, Wendy Preston, Lourarna Gillis, and Nila Lynn Crime Victims' Rights Act (CVRA) became law. The CVRA provides victims of federal offenses with eight rights (protection, notice, presence, conferring, restitution, proceedings free from unreasonable delay, being heard at proceedings, and fair treatment and respect for dignity and privacy), provides standing for individual victims to assert rights in trial courts, and provides victims with the ability to seek rapid and mandatory appellate review if a trial court denies the rights. The CVRA's explicit provision of trial and appellate standing marks a fundamental shift to recognize the individual victim as a participant in the system with legal rights and interests in the criminal case against the accused. As the Ninth Circuit court recognized in *Kenna v. U.S. District Court for C.D. Cal.*, the CVRA rejects the long-held assumption "that crime victims should behave like good Victorian children—seen but not heard."

Battleground Points of the Victim-Participation Model

The movement and its emphasis on reintegration of the victim as a participant with legal rights is

not without objectors; it has three common oppositions. First, the provision of rights to victims detracts from the rights of criminal defendants. Second, the provision of rights to victims intrudes on prosecutorial discretion. Finally, victim participation inappropriately injects emotion and vengeance into the system. In response, the movement posits that victims' rights of privacy, protection, and participation are civil rights that ensure that individual harm is among the harms recognized by the system and that the rights afford voice in the process not a veto on proper discretion. Furthermore, citing to the criminal courts' well-established capacity to afford rights to participants other than defendants (such as the media), the movement notes that the system's accommodation of victims' interests is both possible and desirable.

Future Directions

The victims' rights movement continues to work for creation of additional rights through statutory, rule, and constitutional change at state and federal levels. In addition, the movement has begun using the skills of attorneys to represent victims as they assert and seek legal enforcement of their rights in criminal courts. The movement's victim-participation model will continue to evolve as the criminal justice system accommodates newly established victims' rights and the courts interpret those rights.

VICTIM SUPPORT GROUPS

Victim support groups provide victims of crime with various forms of emotional, physical, and practical aid. With the rise of the victims' rights movement, society has become more aware of the devastation that occurs to the victim of a crime and the intervention that must occur to repair and reintegrate the victim's sense of being. Victim support groups are made available in the United States through funds and support from the community, the National Center for Victims of Crime, the Victims of Crime Act, and the Office for Victims of Crime. Internationally, victim support groups are provided by the community as well as the government (e.g., England and Wales Victim Support, the UN's Victims of Crime Assistance League, and Australia's Victims of Crime).

Operation and Types of Support

Victim support groups operate primarily in a setting in which participant interaction and comfort is maximized in either face-to-face or online forums. They may provide information about navigating the criminal justice system, evaluating relevant and legal information relating to criminal activity, relating the personal experiences of victims, allowing for participants to listen and respond to others' experiences, and providing important social networks for victims.

They aim to include emotional support, practical support, and physical support. Emotional trauma is often regarded as the most damaging component of victimization. Support groups that focus on emotional components offer cognitive behavioral components and posttraumatic stress

therapy and facilitate personal and social trust among its participants. Support groups that focus on practical assistance offer legal information and direction, help with repairs, and aid with security and insurance claims, as well as discuss forms of financial assistance. Physical support groups focus on physical damage (rape survivors and assault survivors) and are more medically oriented than the other forms of victim support groups.

Support groups intend for group participation to help reorient victims' perspectives. Individuals can participate anonymously and they are asked to share their victimization experience. Support groups try to rebuild personal and social trust, provide personal validation, address fears and concerns, and focus on future education, safety, and support. Current support groups primarily provide services for victims of domestic violence, child abuse, elder abuse, families of homicide victims, hate crime victims, and victims of other forms of abuse and neglect.

Effectiveness

Participants of victim support groups claim that the groups are effective and vital to their recovery, but a formal assessment of these groups is difficult. Prior research has focused on specific variables (e.g., social capital and formal/informal networks) and suggests that support groups provide participants with a structure for reframing cognitive barriers and building trustworthy networks. For example, domestic violence victims who participate in victim support groups report significant improvement in levels of self-esteem, a self-focused locus and level of control, a positive change in traditional attitudes toward marriage and the family, lower levels of perceived stress, and more positive forms and thoughts of marital functioning.

Despite positive findings, evidence on their effectiveness and efficacy is contradictory and sometimes inconclusive. Research has also found that study findings do not indicate consistent beneficial effects. In this case, this is sometimes a result of mismatched services, that is, what the victim needs is not what the victim can get from the group. For example, victims of property crime may want practical help (help with repairs, insurance claims, and financial assistance) but were more likely to be offered emotional services (professional counseling).

To demonstrate effectiveness, studies must show that the services provided by a support group aid in the victim actually recovering from the effects of victimization. At a minimum, contradictory evidence suggests that society is strengthened when the community bands together to demonstrate that they care about someone's experiences and recovery from an emotionally and/or physically difficult time.

Research also suggests that key components for an effective victim support group include education and violence prevention, safety prevention for future victimization, and support from law enforcement, religious institutions, and other community organizations. If victim support groups can provide comfort, education, and open discussions, then they serve as an effective means to form a collective voice and community unity for people who share the same experiences, concerns, and interests.

VICTIM-WITNESS PROJECTS

Although victims and witnesses are crucial players in the justice process, they did not receive much

attention in the United States until the last quarter of the 20th century. The halls of justice can be daunting for those people who never intended to pass through those doors. Among the most obvious chores, victims and witnesses will find themselves meeting with the police, answering inquiries from lawyers, and testifying in court. They may be caught off guard by a myriad of other unanticipated activities such as long waits, paying for parking, missing days from work, and the stress of having to recall the criminal event deliberately. In light of these difficulties, system officials have expended efforts to assist victims-witnesses as they are presented with challenges that dissuade subsequent participation in the justice system. The nature of a crime or a person's sense of civic duty might be meaningless if victims-witnesses are constrained by excessive burdens and pressures. The thrust behind victim-witness projects is to provide participants with administrative, professional, psychological, social, and economic advice. Dispensing such services aims to blunt any existing negative stigma and to promote a friendlier, more interactive process.

This entry presents the victim-witness programs, illustrates common features, and questions whether they ameliorate unnecessary costs. The next section highlights important historical developments. Continuing forward, this entry explores the types of projects that have originated and their realms in the justice system. The conclusion reiterates the merit of victim-witness programs, acknowledges several concerns, and offers final remarks.

Historical Events

In the 1940s and 1950s, academic criminologists were busy discussing the treatment of victims and key witnesses. Instead of following suit, the courts began undertaking massive changes toward establishing a moral penal code system. Almost all the states reformed their criminal codes, punishments, and correctional procedures. Realizing that law-abiding citizens had been forsaken for a focus on criminals, the judicial movement shifted its efforts in the 1970s to improving relationships with victims and witnesses—two long-ignored elements of the legal process. The federal government doled out funds to victim-witness assistance programs that were first housed in prosecutorial offices and

then elsewhere. The original intent was to cultivate the projects until they were perceived as necessary, permanent fixtures. At that point, the local governments and judiciary officers were to inherit the financial obligations. Within a short period, several hundred programs sprouted up across the country. Despite proof of greater victim-witness participation and improved conviction rates, the projects failed to attract local funding. As the federal subsidies scaled back, so did the livelihood of these projects.

The 1982 President's Task Force on Victims of Crime conducted a series of public hearings across the nation to assess the criminal justice system and unearth the roadblocks to institutionalizing victim-witness programs. Already victimized once, people relayed countless tales of how their sufferings were amplified via unfriendly officials, scant advice, inefficient bureaucracies plagued with uncomfortable waits, incomprehensible paperwork, and lengthy trials that methodically reintroduced their traumas. In the end, the justice system got the convictions it desired, but at whose expense? Victims and their families were left alone to battle with torn feelings, strained emotions, stifled anguishes, and suppressed psychological afflictions.

The President's Task Force concluded that these conditions within the criminal justice system were exploitive and deplorable. Serious reform was needed to protect victims and witnesses from more losses. Specifically, prosecutors were directed to work more closely with victims-witnesses to develop an embracing, high-quality process of dealing with clients. The next section details that advice and other impacted areas.

Victim-Witness Projects

To understand victim-witness projects, this section discusses the general development of the programs, how they operate, and techniques for successful evaluations. Later, we divide them into four areas to demonstrate their roles in the justice system.

The development stage of a project should identify the target group, learn what the clients want to achieve, and then initiate the process by hiring dedicated personnel. To determine the target group, a program needs to define the potential number and types of clients that will rely on its services. Typically, victimization studies combine population

trends with expectations of criminal behavior. Care should be taken to predict the changes in demographic composition, as well as the impact of recent legislation on sentencing and punishments. To gauge the viability of a program, it is not uncommon to rely on support from other segments of the criminal justice system and academia. With outside help, directors can properly analyze the demand for their services and set practical goals that do not overlap with existing projects.

Based on previous and existing projects, the core activities offered by victim-witness programs include emergency services (shelter, food, financial assistance, on-scene comfort, and medical care), counseling (phone crisis hotline, psychiatric/psychological counseling, and mediation), advocacy and support services (employer or landlord intervention, property return, victim impact reports, and legal/paralegal counsel), claims assistance (insurance, restitution, and compensation), court-related services (witness reception, court procedures, transportation, and child care), post-sentencing services (orientation, notification, and victim-offender reconciliation program), and systemwide services (public education, legislative advocacy, and training). Regardless of which activities are implemented, projects should convey to victims and witnesses the importance of their cooperation and efforts, inform them of their rights, display compassion and understanding, and supply participants with information about meetings and procedures.

Tracking the performance of a victim-witness project is vital to justifying its significance in a community. Programs should compile reports listing items such as the number of staff and clients involved, client satisfaction surveys, evidence of proper staff procedures, awards or recognitions, professionalization of its staff, and grants or other external forms of funding. For successful projects, referrals are common among police, prosecutors, and victims, which result in additional positive feedback and increased business. Undoubtedly, the quality of services is important. Trust and credibility are essential to clients, but are also meaningful indicators of the long-term success of a project.

Because public perception carries such a substantial weight, evaluation techniques are indispensable to programs and the ability to modify procedures is paramount to their survival. Previously, critics

chided prosecutorial offices for becoming “assembly lines” because of their detached approach to the victim-witness. Now, those same projects strive to restore confidence and provide a minimally invasive process. Waiting rooms are decorated with comfortable chairs, magazines, televisions, and courtesy telephones. To accommodate their clients, victim-witness programs promote Web sites that contain links for information, applications, registrations, court procedures, and witness fees. When a program notifies a victim-witness of a court or meeting cancellation, needless trips can be avoided and reduce superfluous costs that were previously commonplace. No longer must victims-witnesses tolerate an additional wave of indirect and direct costs. Instead, they are viewed as the crucial spoke of a powerful wheel.

All these aesthetic and structural changes have been based on two prominent notions in program evaluation: Victims-witnesses are essential to winning convictions and their lack of cooperation is a result of anticipated costs being excessively high. Critics have questioned whether these alterations are worthwhile in a cost-benefit framework. The statistical results are mixed. On the one hand, improved notification practices have little impact on reducing case dismissals and no changes in perceived client attitudes. On the other hand, when victim counselors began testifying in place of the child in juvenile cases, the percentage of guilty verdicts nearly doubled. Subsequently, there were increases in the severity of charges and incarceration rates. Overall, the level of success depends on the type of cases and involvement of victims-witnesses.

The Realms

To this point, this entry has sidestepped a basic question. Where might one expect to find such victim-witness programs? The influences can be grouped by law enforcement, prosecutor, judiciary, and corrections. These programs are considered “internal” to the criminal justice system. Examples of “external” projects are crisis counseling hotlines (e.g., American Red Cross), domestic violence shelters (e.g., Safe Horizon or Refuge House), and grassroots organizations (e.g., Mothers Against Drunk Driving). Programs may fall in other categories, but the internal, system-based

realms are most commonly where a victim-witness will encounter a project.

A law enforcement representative is usually the first official figure to interact with a victim or witness. Given the importance of initial impressions, victim-witness programs try to educate officers on providing a supportive atmosphere and reducing tension. A list of suggested procedures for an officer might entail giving verbal and written notifications of rights; assisting with access to emergency services, financial assistance, and community programs involved in crisis support; shielding the victim from additional suffering; and providing investigative updates. In this realm, the emphasis is on making the victim feel safe yet simultaneously involved in the process. If a secure atmosphere does not materialize, then the victim might grow disillusioned and abandon the case altogether.

Already, this entry has mentioned the involvement of victim-witness groups in prosecutors’ offices. Such programs notify victims-witnesses of trial specifics; consult with them about testimonial procedures, fears, or concerns; encourage expedited processing of emotionally sensitive cases; coordinate expert counselors who can assist with and testify for children; and ensure the prompt return of personal property that was confiscated for evidence. Facilitating information and reducing anxiety are major duties of these victim-witness groups.

Judges can be influential as well, and thus victim-witness program advocates suggest the following recommendations for improvement. Should the case make it to trial, judges should earnestly incorporate victims in bail, trial, sentencing, plea bargaining, and restitution decisions. Instruction should demonstrate a commitment to engaging the victim. As the court proceeds, the judge should advise the victim as frequently as the defendant of his or her rights. The protection of the rights of the victim (and future victims) is a common justification for the involvement of the government in criminal and civil affairs. The judicial approach should emulate that assumption.

As a case leads into the correctional system, the programs continue to exert influence. Any changes in an offender’s status or release should be communicated to the victim-witness. Victim impact panels are a rehabilitative approach to presenting convicted persons with the consequences of their actions on individuals and society. If desired, the

victim should feel just as involved in this last step as in the prior ones.

Across these realms, several themes surface as the victim-witness traverses the halls of justice. These people, like defendants, have rights and should be made aware of them. Future harms and inconveniences should be reduced to a minimum. A sense of involvement and appreciation should invigorate every person—even the dissenting voices that are discussed in the next section.

Criticisms

How has the system changed its approach to victim-witness projects over time? To assess compliance with recommendations from the 1982 President's Task Force, the Department of Justice wrote an upbeat report (*Four Years Later* in 1986) that complemented the evolution of services. However, although the contained statements acknowledged that almost three fourths of the suggestions had been addressed, critics noted that the evidence fell short of demonstrating any long-term sustainability. Nonetheless, the findings were not compelling enough to instigate a subsequent overhaul of the criminal justice system. Years later in 1998, the Office for Victims of Crime underwent a 3-year survey to ascertain the level of conformity with the original ideas. Startlingly contrary results were obtained. Seldom did victims-witnesses receive financial assistance, counseling, information, or advocacy on their behalf. Reiterating the earlier calls for reform, the newer report (*New Directions From the Field*) submitted 250 points on which to improve. Among the reminders are requests for programs to remain client-oriented, offer services that reflect actual desires instead of perceived victim-witness needs, and advance the professionalization of victim advocates. Ethical concerns have also surfaced. Victims-witnesses drop out at various stages because costs become too high or the prosecution no longer needs their testimony. In a perfect world, services would not be limited to just those people who continue the journey throughout the criminal justice system.

Final Remarks

Victims and witnesses bring essential services to the justice system. Without their participation, our

courts would be challenged to ensure procedural due process. Even so, the importance of the victim-witness has been recognized for less than a half century. While initial programs boasted a breadth of goals and services, recent studies question whether the delivery of such promises ever takes place.

After participating, victims and witnesses should be justly compensated for their contribution. Testifying in a court of law is not always a voluntary choice. Involvement places a great strain on individuals, as well as their family members and friends. To make matters worse, reimbursements do not necessarily extend beyond basic fees of parking or a pre-determined, average daily wage. When victims-witnesses protest their involvement or approach the proceedings with an apathetic attitude, one might question whether their reactions are a result of risk-averse people trying to avoid the myriad of additional costs inherent in an unapologetic justice system. Advocating on behalf of their clients, victim-witness programs must mindfully insist on receiving what their clients actually demand and not what others think their clients want. Future improvements should continue to address the requests of these acute parties so they may avoid additional tribulations. After all, these people had no original intentions of disrupting the normalcy of their daily lives.

VIGILANTISM

When in certain societies, usually in unsettled or frontier conditions, existing institutions and conditions prove inadequate to the enforcement of criminal laws, individuals, or more commonly, groups, will work “outside the law” and prescribed institutions to achieve justice and/or stability. The practice of setting alternative arrangements to state-sponsored criminal justice components is called vigilantism. Vigilantism has many faces and adapts to a wide variety of social circumstances. In some instances, these solutions take on a quasi militaristic manifestation, whereas in others, vigilantism has a mercantile, Chamber of Commerce flavor. The anti-labor or racist lynchings of the past were viewed by participants as socially preservative vigilante actions. Moreover, political change efforts have incorporated vigilante behavior. Finally, individuals who have acted violently to protect themselves have been labeled, erroneously,

by the media as “vigilantes.” Today, “Internet vigilantism” has become both a reality and a concern. This entry presents several historical examples of vigilantism.

Regulators

South Carolina was the site of extensive political and person violence during the frontier period, especially before and during the American Revolution. Factional violence and continuing feuds created such chaos in the backcountry, particularly in the north and central parts of the state, that partisan bands had free rein. Local groups of Regulators arose in both Carolinas, took on military formation, and drove outlaws and partisan bands from their areas. In 1771, before the American Revolution, they came into active conflict with British colonial troops. Their goal was to end out-lawry and corruption and to achieve better government in their areas.

California Vigilantes

The California gold fields and San Francisco Committee of Vigilance are probably the most well-known movements of this kind in the United States. In the gold fields crimes were frequent and justice hard to find. Kangaroo courts followed by a hanging or tarring and feathering were frequent outcomes. San Francisco businessmen were appalled by misgovernment and the tolerance of violent crime that typified that city's criminal justice response. Accordingly, in 1851, they created a vigilance committee which held court and engaged in citizen-based community policing. Famously, a few malefactors were hung but others were exiled to Australia or whipped. Again, in 1856, the committee was reconstituted and focused on political corruption as well as criminal issues. This committee had wide public support, controlled the press, and was backed by local militia units.

Texas Regulator/Moderator Violence

In Texas of the 1830s and 1840s, unsettled conditions produced the Regulator/Moderator War along the Louisiana/Texas frontier (“the Sabine strip”). In this frontier area, institutions of law were so inadequate that vigilante law was the only

functional form of justice. But Regulators came into being to straighten out perceived injustices, and Moderators arose to counter the Regulators. These conflicts only ended when the Republic of Texas sent in the militia. After the Civil War, unrest festered in central Texas and spontaneous vigilante movements arose to deal summary justice to horse and cattle thieves. In fact, those caught in the act were often hung or shot on the spot. At times, vigilante groups stormed the county jails and shot suspects in their cells. Sheriffs thought to be in league with rustler gangs were sometimes killed in these actions. Texas Rangers were called in to deal with the situation when vigilante violence and counter violence got out of hand. In the period after the war, violence raged between unionists and pro-Confederate families and vigilante groups. Much violence of this nature continued in Texas until the end of the century.

New Orleans Vigilantism

New Orleans vigilantism in the 1850s concerned the efforts of political elites to wrest power from the corrupt ruling party. In fact, the future Confederate General Beauregard ran against a corrupt New Orleans machine and lost. After the war, several clearly vigilante insurrections against the Federal regime and the New Orleans police occurred. But the most notorious “vigilante” event in American history was the 1891 lynching of 11 Italian immigrants for their supposed involvement in the murder of the chief of police. This event, which was an action against supposed “mafia” corruption of the courts, caused a rupture in relations between the United States and Italy, and it did nothing to curb the eventual ascendancy of the Italian-American organized crime in the Crescent City.

The Guardian Angels and the Goetz Trial

High concern about victimization led to the founding of the Guardian Angels in New York City in 1979. Not actually a true vigilante group, as they imposed no punishments but simply “patrolled” high-crime areas in flashy red berets, they received enormous media attention for several years. Founder Curtis Sliwa was a frequent guest on talk shows. In this climate of media attention, in 1984, a self-employed electronics technician Bernard Goetz,

shot four Afro-American panhandlers who he perceived as menacing him on a subway. Eventually, “the subway vigilante” who was supported in court and in the media by the Guardian Angels was only convicted of criminal possession of a weapon and given a light sentence. A later civil trial awarded one of his victims a large settlement. But the quiet and soft-spoken Goetz became a symbol of vigilante-type reaction to urban crime and a celebrity.

Internet Vigilantism

Internet vigilantism refers to computer users employing computers to bait or punish computer-based malefactors. An example is the television show *To Catch a Predator*, in which confederates of the show, using Internet chat rooms, lure would-be pedophiles into fake assignments with minors. When the alleged predator arrives at the scene of the proposed tryst, they are shamed and harangued by a television personality and are forthwith arrested by a local law enforcement agency. As might be expected, many of these arrests have ended in dismissed charges, but disgrace and stigma linger. Some agencies routinely “troll” for sex offenders in this manner and have agents dedicated to that task.

More commonly, vigilantism on the Internet refers to individuals shaming fellow students for various faux pas or Internet users hatching elaborate schemes to trick and punish those who perpetrate internet frauds, such as “Nigerian scams.” Turning victimizers into victims, they frequently lead the con man/woman into traveling to an unsafe environment in search of easy money or another con. Like the Regulators of old, these Internet vigilantes act in the vacuum created by the inability of government to deal effectively with the huge task of policing a new frontier—in this instance, the Internet.

VIOLENCE, PROTECTION AGAINST

Violence in the United States is common. According to the National Crime Victimization Survey (NCVS), more than 6 million rapes, sexual assaults, robberies, and assaults were reported in the United States in 2006. In addition, data from the Federal Bureau of Investigation's (FBI's) Uniform Crime Reporting (UCR) Program indicate that 17,034 individuals were murdered in the United States in 2006. People can try to prevent themselves from being the victim of violent crime in various ways. Many of these measures fit into routine activities theory's concept of increasing guardianship. Thus, this entry begins with a discussion of routine activities theory. It then reviews some of the various measures that individuals may take to protect themselves from being the victim of a violent crime, including carrying self-protective devices such as mace or pepper spray, carrying a weapon, using physical and/or verbal resistance, and for victims of intimate partner violence, seeking civil orders of protection. Finally, because alcohol seems to play an important role in victimization, its role is discussed.

Routine Activities Theory

Research has shown that criminal victimizations are not randomly distributed across society. Instead, victimizations are associated with peoples' lifestyles, daily routines, and demographic characteristics. Routine activities theory postulates that for a crime to occur, three elements must be present: a likely offender, a suitable target, and the absence of a capable guardian. According to routine activities theory, one way to avoid being a victim of a crime is through increasing guardianship. Individuals can try to increase guardianship through measures such as carrying a gun or other

form of self-protection (e.g., mace, pepper spray, club, bat, body alarm, or knife), installing burglar alarms, living with other adults, or going out in public with other people rather than alone. Research suggests that not all individuals are equally likely to employ measures of guardianship. For instance, Richard Tewksbury and Elizabeth Mustaine, in their study of 1,513 college and university students, found that students' employment of self-protective devices (i.e., gun, mace, club, body alarm, and knife) was dependent on various factors. Specifically, students were more likely to use self-protective devices if they were unemployed, spent a lesser percentage of time during the week with strangers, resided in neighborhoods characterized by social disorganization, used crack recently, and felt safe in their homes at night. Although this last finding (feeling safe in their homes at night) may seem contrary to expectations, the authors point out that a "time-sequencing issue" may be involved. In other words, it is possible that individuals who feel safe at home feel this way *because* they are using one or more forms of guardianship.

Weapon Possession

As noted above, one way that people may attempt to protect themselves from being a victim of crime is by carrying a weapon. Results from the 1993 National Self-Defense Survey conducted by Gary Kleck and Marc Gertz indicated that almost 9% of adults carried guns in the previous year, 3.7% carried guns on their person, and 6.5% carried guns in their vehicle. Research has found certain characteristics to be associated with a higher likelihood of carrying weapons. For instance, Kleck and Gertz's study found that African Americans were more likely than Whites to carry weapons. They also found gun ownership to be more prevalent among males and among people in the South and West. Finally, they found that individuals who knew someone who had recently been the victim of a crime, individuals who had been a victim of robbery, and individuals who believed people must rely on themselves for protection were more likely to carry guns.

Researchers disagree as to whether possessing or using a weapon actually decreases a person's chances of being a victim of violent crime. It seems

that the effect of guns may be partially dependent on the particular type of crime. For instance, Gary Kleck and Don Kates, using data from the 1992–1998 National Crime Victimization Surveys (NCVS), found that using a gun reduced the risk of property loss in robberies and did not increase the risk of injury to the victim. However, several studies examining homicide have not found weapon possession to be associated with a reduction in risk of victimization. For example, Arthur Kellermann and his colleagues, in their analysis of homicides in three metropolitan counties, found that keeping a gun in the home was strongly associated with an *increased* risk of homicide. They note that almost all of this risk was attributed to homicides by a family member or an intimate acquaintance. Similarly, Peter Cummings and his colleagues examined handgun purchases from licensed dealers and found that a history of a family handgun purchase was associated with an increased risk of homicide, which lasted for more than 5 years after the weapon purchase. Thus, although some evidence indicates that the use of guns may reduce the risk of robbery completion, other evidence indicates that guns may increase the risk of homicide victimization.

Physical Resistance

The previous section discussed the impact of gun possession and use on violence. Research has explored the more general use of physical resistance in violent victimizations. Researchers have divided physical resistance measures into two types: forceful physical and nonforceful physical. Forceful physical resistance refers to active aggressive behaviors used by victims against offenders to stop an attack, such as wrestling, punching, biting, scratching, kicking, and using a weapon or martial arts techniques. Nonforceful physical resistance refers to passive physical behaviors used by victims to avoid an attack. Examples include trying to avoid the offender, removing the offender's hands, pulling away from the offender, and running away from the offender.

Researchers have examined the effectiveness of physical resistance measures on various types of violence including rape, robbery, and assault. Using data from the NCVS, Shannon Santana found that the use of both forceful physical and nonforceful physical resistance decreased the likelihood of both

rapes and robberies from being completed. Similarly, Jongyeon Tark and Gary Kleck found that victims who used various forms of physical resistance were less likely to suffer a completed robbery (i.e., experience property loss). Specifically, they found that victims who attacked with a gun, attacked with a nongun weapon, attacked without a weapon, struggled, or ran away or hid were less likely to suffer a completed robbery than people who did not resist. Finally, Santana found that the use of both forceful physical and nonforceful physical resistance was associated with a simple, rather than aggravated, physical assault.

Verbal Resistance

Several studies have also examined the impact of victims' use of verbal resistance. Researchers have divided verbal resistance measures into two types: forceful verbal and nonforceful verbal. Forceful verbal resistance refers to active verbal strategies designed to scare the offender and/or attract help. Examples of forceful resistance include screaming, yelling, and threatening the offender. Nonforceful verbal resistance refers to the victim using nonaggressive verbal strategies such as trying to reason with the offender, pleading, begging, or crying.

Research has explored the effectiveness of forceful verbal and nonforceful verbal resistance strategies in rapes, robberies, and physical assaults. The research generally indicates the beneficial nature of forceful verbal resistance in rapes and robberies. Specifically, Santana's research found forceful verbal resistance to be associated with rape avoidance and robbery avoidance; however, the use of forceful verbal resistance was found to be associated with aggravated, or more severe, physical assault.

In terms of nonforceful verbal resistance, a review of the research by Sarah Ullman indicated it is ineffective in avoiding rape. Similarly, research by Santana suggests that nonforceful verbal resistance is not effective in terms of preventing robbery completion or in avoiding more severe physical assaults.

Civil Protection Orders

Besides using measures of resistance, another way that people can try to prevent themselves from being a victim of a violent crime is by seeking a

civil protection order (also referred to as injunctions or restraining orders). Orders of protection are primarily used by victims of intimate partner violence. These civil protection orders prohibit perpetrators of intimate partner violence from having contact with the victim for a specified amount of time. If the offender violates the conditions of the protection order and the police are called, then the offender can be held in civil or criminal contempt or criminal charges may be filed.

Research on the effectiveness of civil protection orders is inconsistent. Judith McFarlane and her colleagues reviewed eight longitudinal studies on protection orders and found that six studies reported positive results; in other words, the victims felt the protection order aiding in stopping or decreasing the violence. However, the other two studies found high rates of reassault for the victims who filed protection orders. McFarlane and her colleagues' own study found lower levels of intimate partner violence after women applied for protection orders. Interestingly, they found reduced levels of intimate partner violence among both women who were granted protection orders and among those who, for various reasons, did not ultimately receive protection orders.

The Correlation Between Alcohol Use and Being the Victim of Violent Crime

Research reveals that many victims of violent crime are under the influence of alcohol. The association between frequent alcohol use and victimization is consistent with routine activities theory because individuals who are drunk are less able to "guard" or defend themselves effectively. Using data from the Violence Against Women Survey, Richard Felson and Keri Burchfield found that the role of victims' alcohol use differs depending on factors such as the victim's relationship to the offender, gender, age, and nature of the crime. Specifically, they found drinking to be a greater risk factor for male victimization than for female victimization. They postulate that this is because intoxicated men are more likely to provoke other people than intoxicated women. In addition, they found that young adults are more likely to be victimized while drinking than older adults. They hypothesize that this is because young adults who are drinking engage in more provocative behavior

compared with older adults who are drinking. In terms of the nature of the crime, they found that drinking is a greater risk factor in sexual assaults than in physical assaults. Finally, they found that men who were assaulted by their female partners were especially likely to have been drinking. Findings such as these suggest that one way that individuals can protect themselves from being a victim of violent crime is through limiting their consumption of alcohol. Because studies have found that alcohol plays a large role in violence and victimization among college and university students, college and university administrators are under pressure to reduce alcohol consumption on their campuses.

VIOLENCE, THEORIES OF

Most theories and research examining the causes of violence have focused on one level of explanation, with particular attention to individual reasons for engaging in violent behavior. Given the lack of theoretical integration, some contend that the epidemiological approach may be more appropriate to understanding violence. The epidemiological approach involves identifying both risk and protective factors that increase or decrease one's chances for engaging in violent crime, respectively. Although the epidemiological approach does result in critical insights into the utility of biological, psychosocial, macrosocial, and situational risks for violent crime, it is an atheoretical approach. Many researchers and scholars consider this problematic because it leaves one without an understanding of the mechanisms for how risk and protective factors operate, which downgrades the efficacy of potential policy implications that stem from this research. Without a complete understanding of the multilayered causes of violent crime, implementing policies to decrease violence may reduce it but not necessarily to the greatest extent possible. To understand violence more fully it is critical to consider the causes of violent crime from theoretically derived frameworks that take into account various microlevel and macrolevel causes.

The purpose of this entry is threefold. First, fundamental types of violent behavior are defined and levels of explanation are conceptualized. Second, theories that explain why individuals and groups (or neighborhoods, regions, etc.) are violent are reviewed. Third, theoretical integration is

explored by discussing the merger between individual and aggregate level explanations. Because most theories are developed to explain behavior at a single level of analysis, key theories at two separate levels of explanation are discussed. Theoretical explanations for individual involvement in violence and macrosocial explanations that account for aggregate level differences in violent crime are discussed. Finally, a discussion of the efficacy of integrated, multilevel theories of violence is presented, and ideas for future research and theoretical development are offered.

Violent Crime and Levels of Explanation

Violence differs from aggression in that the former is a more restrictive concept excluding behaviors that lack intentionality with respect to physical harm. Violent crime is a special case of the broader term *violence*, which includes only violent behaviors that have been criminalized by formal legislation. Violent crime naturally varies across space and time, but the most serious types are generally recognized as crimes that include homicide, rape, robbery, and aggravated assault.

A considerable variation in behavior is found both between and within individual violent crime categories such as homicide, which makes explaining violent crime difficult. Two fundamental types of violent behavior are commonly accepted by experts. *Instrumental violence* refers to the purposeful use of violence as a means to achieve an end goal such as stealing money. Instrumental violence is often planned and nonemotional. In contrast, expressive violence refers to the use of violence with the sole intent to cause physical harm. *Expressive violence* often occurs in the heat of passion to settle grievances. However, not all crimes neatly fall into either of these two categories. Nevertheless, the difference between these two fundamental types of violence is important because some theories may be relevant predictors for one or both types of violence.

When considering integration of violent crime theories, it is important to understand various levels of explanation. Albert Reis and Jeffrey Roth identify two overarching levels of explanation including individual and social levels. However, James Short recognizes three distinct levels of explanation including the individual, microsocial,

and macrosocial levels. Theories at the individual and macrosocial levels of explanation seek to understand why some individuals or groups engage in violent crime more than other individuals or groups, respectively. Although each level separately is important and explains a piece of the violent crime problem, the goal should be theoretical integration across levels to develop a coherent and complete understanding of violent crime.

Individual-Level Theories of Violent Crime

Biological Theories and Biosocial Perspectives

Biological theories hold that the biological makeup of an individual directly influences violent crime. The earliest of these was developed by Cesare Lombroso, who hypothesized that atavists (i.e., evolutionary throwbacks) were born criminals who could not control their behavior. Although Lombroso's work has pointed to the importance of examining biological influences, early biological theories have largely been discredited. More recently, the *super-male theory of violence* has been developed, which posits that violent crime is caused by a chromosome abnormality in which males are born with a XYY chromosome pattern as opposed to the normal XY pattern. It is an empirical fact that males commit more violent crime than females, and this additional Y chromosome is hypothesized to augment male violent behavior. Whereas the prison population contains a somewhat higher proportion of XYY males than the general population, the practical differences are minimal indicating that the super-male theory is, at best, a weak explanation of male violent crime. Individual genes or isolated chromosome abnormalities alone are highly unlikely to have large significant direct effects on violent crime.

Scholars have noted that biological explanations are complementary to psychosocial explanations of behavior and their interaction provides a more complete explanation of violent crime. Biosocial researchers contend that individuals inherit factors that influence their responses to particular environments as opposed to inheriting specific genes or traits that directly influence behavior. Given the wide range of biological, psychological, and social variables that can interact to

cause violence, biosocial models serve as frameworks to contextualize biosocial research findings, but there is still a critical need for biosocial theoretical development. Three theoretical propositions in the areas of neurochemistry, neuropsychology, and behavioral genetics are explored next.

Angela Book et al. conducted a meta-analysis of 45 neurochemical studies that examined the link between testosterone and aggressive behavior and found evidence for a weak but significant relationship. Recently, Alan Booth et al. articulated a biosocial explanation of antisocial behavior incorporating individual development, parent-child relationship quality, and both parent and child testosterone levels. The model hypothesizes that a child's testosterone can have direct effects on violent behavior as well as indirect effects operating through individual development and parent-child relationship quality. Additionally, a parent's testosterone level can influence the parent-child relationship quality, and importantly, this factor can moderate the direct effect of child testosterone on violent behavior. However, neurochemical theorists should recognize that behavior may influence levels of testosterone too. Nevertheless, testosterone remains an important explanation of expressive violence in part because of its ability to account for the age-crime curve (i.e., the increase in violent crime at puberty, the peak in late adolescence, and decline in early adulthood).

A consistent negative relationship is found between IQ (Intelligence Quotient) and delinquency, which indicates that neurological functioning leads to antisocial, violent, and aggressive behaviors. Terrie Moffitt offers a neuropsychological model for delinquency, including violence, which hypothesizes that neuropsychological deficits of higher-order mental functions (e.g., verbal, visual-spatial, verbal memory, visual-motor integration, and mental flexibility) lead specifically to "life-course persistent" antisocial behavior. The population is theorized to include two fundamentally different subpopulations of offenders: "life-course persistent" and "adolescent-limited" offenders. Relevant to the current discussion are life-course persistent offenders, who commence violence and other criminal behaviors prior to adolescence and continue their offending into adulthood. Although there is disagreement over the exact number of distinct subpopulations, life-course persistent offenders

are more likely to be violent. Thus, the neuropsychological model holds promise as an explanation for expressive violent crime among life-course persistent offenders.

Sarnoff Mednick has proposed an articulated biosocial explanation for delinquent behavior. The social component of the theory holds that consistency in punishment is required to instill fear in children for committing particular acts. When an individual avoids engaging in a criminal act, his or her fear is alleviated, which reinforces civilized behavior. Importantly, the reinforcement is a function of the time it takes to alleviate the experienced fear; this process is controlled by the autonomic nervous system. The biological component stems from the inheritance of deficient autonomic nervous systems, which are slow to recover from fear resulting in inadequate reinforcement of civilized behavior. Therefore, individuals who inherit deficient autonomic nervous systems and who experience inconsistency in punishment are at the highest risk for violence. Evidence suggests that low autonomic functioning is a consistent and significant predictor of violence, and Mednick's theory is particularly useful for explaining instrumental violence. It should be evident from this review that biosocial theories of violent crime have already taken a step toward theoretical integration at the individual level.

Psychosocial Theories

Social learning seeks to explain how violence is transmitted from one individual to another. Ronald Akers's social learning theory encapsulates differential association theory with three other behavioral constructs including definitions, differential reinforcement, and imitation. Differential association refers to direct interaction with deviant others and the resultant exposure of values. Definitions refer to the meaning one ascribes to particular behaviors. Differential reinforcement refers to the balancing of rewards and punishments, which are a function of prior and current experience as well as future expectations. Finally, imitation refers to reproducing a model's behavior. The theory holds that individuals who are differentially associated with more violent individuals, have more favorable definitions of violence, are differentially reinforced toward violence (more rewards than costs), and imitate the behavior of criminals are more likely to engage in

violent crime. Social learning theory can account for both expressive and instrumental violence.

Control is an individual trait that *prevents* one from engaging in violent crime. Hence, control theories attempt to explain why an individual fails to engage in violent crime, which is a unique theoretical contribution and an important complement to other individual-level explanations of violent crime. Michael Gottfredson and Travis Hirschi's self-control theory, which hypothesizes that crime, including violent crime, is caused by the interaction of low self-control and criminal opportunity. Self-control is the tendency to consider the long-term costs of a particular act. Individuals with low self-control tend to be impulsive, risk seeking, and self-centered, and they also have a temper, a preference for physical tasks over mental ones, and a preference for simple tasks over harder ones. Low self-control is the result of ineffective parental socialization during the formative years; it crystallizes within an individual around the age of eight and remains stable throughout life. Low self-control is a strong predictor of crime and analogous behavior across divergent samples. Given that their definition of violent crime involves gains, self-control theory is relevant only for instrumental violence. However, their definition of violence is unnecessarily limiting, and thus, it would seem that self-control could also explain impulsive (expressive) violence.

Another variety of control theory is social control theory (i.e., social bonding theory), which hypothesizes that individuals with weak social bonds are more likely to engage in crime. Hirschi claims that social bonds are composed of four elements: attachment, commitment, involvement, and belief. Individuals with strong attachment to others and strong commitment to conventional activities are less likely to engage in crime because important consequences that could result from engaging in deviant behavior. Additionally, individuals who are highly involved in conventional activities simply have less time to commit crime, and those who believe in conventional norms are less likely to commit crime. Although social control and self-control theories are traditionally considered separate explanations of crime, Hirschi claims that they are the same thing.

Gresham Sykes and David Matza reject the notion that individuals subscribe to a deviant set of

values; rather, they hypothesize that crime is the result of the successful employment of techniques of neutralization, which are justifications for a momentary failure in adherence to conventional norms. These excuses for violent behavior are only used by individuals who generally adhere to conventional norms or who do not belong to a subculture of violence. Several neutralization techniques seem particularly relevant for explaining expressive violent crime, which include denial of responsibility (e.g., “they started it so it is not my fault”), denial of the victim (e.g., “they had it coming to them”), and appeal to higher loyalties (e.g., “my friends needed me”). Neutralizations seem particularly relevant in rationalizing expressive violence but could also account for instrumental violence. For example, denial of injury (e.g., “it didn’t really hurt anyone”) rationalizes instrumental violent crime. Techniques of neutralization neatly account for the fact that individuals do not constantly engage in antisocial behavior and instead tend to “drift” in and out of delinquency.

Macrosocial Theories of Violent Crime

Whereas biological and psychosocial factors are largely responsible for driving individual differences in violence, macrosocial forces are factors that influence group differences in violent crime. Norbert Elias’s “civilizing process” theory contends that state formation causes an increase in human interdependencies and a state “monopoly on violence” with respect to both means and use of physical force. As a state forms, social elites instill social constraints on their class to differentiate themselves from lower classes. Over time, social constraints become internalized (i.e., self-restraint develops), and social differentiation leads to social integration as constraints trickle down to lower classes. The civilizing process denotes an important shift in violence from expressive to instrumental. More specifically, there is a rise in repugnance thresholds for violence, an increase in drive-controls and guilt, a removal of violence from everyday life, and an increase in instrumental violence. Elias’s theory is highly important as it accounts for historical changes in violence rates in America. Moreover, the theory can account for group differences in violent crime within America. First, social constraints may fail to trickle down to

lower classes. Second, decivilization, or state withdrawal, can occur, which leads to an increase in violence committed by a particular group.

According to Donald Black, violence can be viewed as a form of social control when it responds directly to deviant conduct or defines certain conduct as deviant. Black’s theory of self-help contends that citizens are more likely to engage in self-help (i.e., the expression of a grievance through aggression) when law is not an option. Importantly, the availability of law to settle grievances is not constant across social groups. Consequently, the rates of expressive violence are higher for social inferiors since self-help is, or perceived to be, their only option for justice, whereas it is lower for social superiors since they have the choice between engaging in self-help and employing the law. Thus, an unformed state or the unavailability and illegitimacy of law and legal institutions of a formed state can cause high expressive violent crime rates.

Social disorganization theory holds that neighborhoods that are socially disorganized are more likely to experience disorder, crime, and violence. Socially disorganized neighborhoods are characterized by high levels of population turnover, ethnic heterogeneity, and concentrated disadvantage (e.g., low socioeconomic status and unemployment). Social disorganization theory claims that the extraordinary social conditions in which ordinary people live cause crime and violence. However, focusing solely on population turnover, ethnic heterogeneity, and concentrated disadvantage fails to explain the mechanisms that drive the relationship between social disorganization and violence. Robert Sampson and colleagues propose that neighborhood collective efficacy (i.e., social cohesion and trust amongst neighborhood and their willingness to intervene for the common good) is related to violent crime; neighborhoods with high levels of collective efficacy are more able to activate and employ informal social control and, resultantly, have lower rates of violence. Population turnover, ethnic heterogeneity, and concentrated disadvantage explain a substantial portion of the variation in collective efficacy across neighborhoods, and the effects on violence were either completely or partially mediated by collective efficacy.

In his classic work on suicide, Émile Durkheim employs the term *anomie* to describe a state of

normlessness, in which the behavior of citizens fails to be socially controlled. For Robert Merton's institutional anomie theory, anomie occurs when a disconnect exists between esteemed cultural goals (i.e., wealth attainment) and legitimate methods to attain them. Although society strongly emphasizes the achievement of cultural goals, it tends to care less about how those goals are attained, albeit legitimate means are preferred to illegitimate means. Merton contends that this means–end disconnect is a product of the American social structure. Legitimate means are differentially available to various social and ethnic classes. For example, racial minorities and those of low socioeconomic status have fewer legitimate opportunities to achieve wealth and success. Building on Merton's institutional anomie theory, Steven Messner and Richard Rosenfeld identify the following four core cultural values: achievement (occupational success), individualism (obtain success independently), universalism (objective evaluation), and fetishism of money. They contend that the economic institution devalues the importance of other institutions such as family and education (e.g., the homeowner is valued more than the homemaker). The economic institution compels other institutions to accommodate it (e.g., education serves to prepare one for work). Additionally, the norms of the economic institutions spread to other institutions (e.g., families operate like businesses). These processes collectively create an "institutional imbalance" in which the social control capacities of familial, political, and educational institutions are compromised, which leads to increases in instrumental violent crime rates.

Subcultural explanations of violence seek to explain why particular regions or cultures within a particular nation state have abnormally high violent crime rates. Marvin Wolfgang and Franco Ferracuti infer that young Black males constitute a subculture of violence because they have the highest rate of violence. Their theory holds that individuals who belong to a subculture of violence develop a differential psychology in which jostles, daily frustrations, and the presence of weapons, for example, are more likely to be responded to with violence. Put another way, members of a violent subculture legitimize violence in certain situations such as to persevere their honor or respect. Although research suggests that many delinquents do not

generally approve of violent behavior, there is reason to believe some individuals do in fact adhere to subcultural values. Perhaps, the problems with the instrumental–expressive dichotomy are no clearer than with the subculture of violence theory. Whereas subcultural violence could be classified as expressive since violence is often impulsive, the maintenance of honor is a clear end goal for members of the subculture. Thus, subculture of violence theory may explain both types of violence.

Multilevel Integration: Data and Examples

Despite a wealth of understanding of violence at the individual and macrosocial levels separately, much remains unknown about how these two levels are linked to explain violent crime. Policies targeting a reduction in violent victimization will be strengthened by the development of theories that take into account both individual and macrosocial forces. Multilevel integrated theories of violence can be developed from two directions simultaneously. First, the identification of risk and protective factors through empirical data mining has direct relevance for theory development. That is, if researchers and scholars know which factors are related to the presence and absence of violent crime, they can construct theories that account for these empirical facts. Although this approach is worth subsequent exploration, numerous existing theories, several that were reviewed here, are ripe for theoretical integration. Then, linking existing theoretical explanations across levels of explanation is a second approach to the development of a comprehensive understanding of the causes of violence.

A major obstacle to the development of multilevel theories of violent crime has been the mutually reinforcing problem of inadequate data and insufficient theoretical complexity. In the past, existing data sets were not complex enough to develop and test multilevel theories of violence, and these theories were not sufficiently developed to spark appropriate data collection. This is not true today.

Studies examining multilevel theories require data that have a nested structure such that individuals are nested within some macrosocial context. The Project on Human Development in Chicago Neighborhoods (PHDCN) offers a wealth of data in which individuals are nested within

neighborhoods. The PHDCN is a compressive data collection effort aimed, in part, at uncovering the developmental and contextual causes of violence and other behavioral outcomes. A major component of the study involves the accelerated longitudinal cohort design that followed seven birth cohorts for three waves of data collection. Additionally, the PHDCN has community survey and systematic social observation data at the neighborhood cluster level. These features of the PHDCN make it an ideal data set for both testing multilevel theories of violence and developing them by employing the epidemiological approach to the study of violent crime.

One particular example of an integrated theoretical approach to understanding violence is from Akers's social structure social learning model. Akers links individual learning principles to macrosocial structural contexts. He identifies four social structure variables, which are hypothesized to have indirect effects on crime and violence operating through the aforementioned social learning variables. First, differential social organization refers to community characteristics such as population density and age composition that influence community crime rates. Second, differential location in the social structure refers to sociodemographic characteristics such as ethnicity and race that indicate social standing within the social structure. These two macrosocial constructs are responsible for structuring individuals' general learning environments. Third, differential social location refers to memberships in and relationships to groups such as the families and colleagues. This factor structures individuals' more immediate learning environments. Finally, theoretical structure variables refer to constructs such as anomie and social disorganization that have been used to explain variations in crime rates and are hypothesized to influence social learning variables. It is this idea where theoretical integration between existing macrosocial theories and social learning theory holds promise. However, the inclusion of macrosocial theories (e.g., institutional anomie, subcultural) into the social structure social learning framework has not been entirely mapped out. Nevertheless, Akers's work is an important contribution demonstrating that macrosocial forces may be mediated by individual social learning processes. Additional research is

necessary to develop these notions. Moreover, the possibility of incorporating biological and other psychosocial factors to develop a more complete understanding of the causes of violent crime should be explored.

Conclusion

Major theories of violent crime have been considered at two levels of explanation, namely the individual and macrosocial levels. Individual-level theories include both biological and psychosocial theories that seek to explain individual variation in violent crime. Macrosocial theories seek to explain group- or aggregate-level variation in violent crime. It has been argued that advances in our policies aimed at reducing violent victimization will parallel theoretical integration between the macrosocial and individual levels of explanation of violent crime. This will occur because theories that take into account multiple levels yield a more fundamental and complete understanding of the causes of violence. Quality data sets are available to aid in theoretical development and to test existing multilevel theories. Moreover, existing theories at the individual and macrosocial levels of explanation await theoretical integration. Given the seriousness of violent crime, developing and testing multilevel theories that account for both expressive and instrumental violent crime is an important endeavor that should be actively pursued.

The review of violent crime theories and the connections made between the levels of explanation herein are not without important qualifications. First, there are other theories, not reviewed here, at both the individual and macrosocial levels of explanation, which are relevant to explaining violent crimes. Second, this entry reviewed only key theories at the individual and macrosocial levels of explanation. Although individual and macrosocial explanations explain why individuals and groups differently engage in violence, they do not explain how interactions and situations contribute to violent outcomes. Third, this entry only begins the journey of exploring theoretical integration across levels of explanation.

VIOLENCE AGAINST WOMEN ACT OF 1994 AND SUBSEQUENT REVISIONS

Violence against women and domestic violence are major social concerns. Women and leading representatives of the Women's Liberation Movement during the 1960s and 1970s began a continued process of requesting legalistic changes protecting females from systematic violence. The Violence Against Women Act (VAWA) was originally proposed in 1990 and supported by congressional investigation of domestic violence situations. Congressional testimony by women victimized through violence was obtained in separate proposals within the period from 1990 to 1994. The measure was passed as a portion of the Omnibus Crime bill in 1994.

Provisions of the 1994 Legislation

The VAWA was divided into three separate areas in defining protection against violence against women and domestic violence. The first area concerned the area of funding. The VAWA provided \$1.6 billion over 6 years for education, research, treatment of domestic and sex crime victims, and the improvement of state criminal justice systems. There was a distinct realization among lawmakers and advocates for a policy change that the public and officials entrusted with protecting the rights of women needed both technical and practical information in understanding the problem of violence against women. In addition, the solutions could not come until the legal system could find remedies in dealing with the problem.

Thus, research in the area of violence against women was encouraged through federal grants solicited through programs funded by the National Institute of Justice. Funds were distributed to research agencies and scholars in an effort to probe the extent of violence against women and domestic violence. Women's rights groups throughout the country also participated in gathering information and submitting policy recommendations to federal agencies engaged in formulating legislative measures designed to protect women.

In addition, funds were allocated to improve the treatment of domestic and sex crime victims. In the past, domestic and sex crime victims often received little or no follow-up treatment from criminal justice authorities or victim services agency personnel. Much of this is attributable to a lack of financial resources. The available funds now enabled the strengthening of ongoing local victim services programs and the establishment of new outreach efforts within the community and the criminal justice system.

In particular, sex crime victims received more systematic attention from crime victim agencies and members of the criminal justice system. In the past, such violations as rape were not treated thoroughly because of a lack of criminal justice education on rape offenses and the training of officers to collect evidence useful for later prosecution.

Finally, federal funding served to improve the state criminal justice system response to violence against women. State and local agencies were faced with allocating priorities predicated on available funding. Task forces on violence against women and rape were negligible or nonexistent with the ongoing focus on violent crime and the processing of other everyday criminal incidence. Significant federal funds enabled the creation of sustained programs aimed at specifically targeting violent crime against women and domestic abuse or sex crimes. Personnel could be trained and additional officers or specialists hired to deal with the incidence of violence against women.

The VAWA also served to provide significant services for victims of violence. Funds were allocated for increasing safety for women on public transportation. More police officers could now monitor buses and subways throughout metropolitan areas.

Shelters were also funded through this legislation. Few shelters are available for battered women.

The lack of such resources restrains women from leaving situations where domestic abuse is a regular occurrence. The creation of more shelters meant that victim service agencies now had the ability to help women successfully leave life-threatening situations.

Youth education programs were also covered under the VAWA. One of the leading causes of domestic abuse is the lack of education afforded to at-risk youth who are likely to engage in battering behavior. The ability to detect individuals early in this behavior cycle can serve to prevent such incidents in the future and prevent future female victims of abuse and sex crimes.

Another function of the VAWA focused on the training of judges and other court personnel in dealing with gender bias within the courts. Judges and other administrators were either unaware or indifferent about the protection of females as victims of violence.

Rape cases sometimes went unprosecuted when district attorney offices prioritized other violent criminal cases in place of sex crimes. A significant factor was the increased effort in gathering evidence and the mind-set of prosecutors. Rape cases were often dropped through failure to take allegations seriously and undertake serious prosecution. Judges frequently expressed the same bias in failing to understand the physical and mental anguish experienced by female victims testifying in a courtroom setting.

The VAWA also focused on two other aspects related to knowledge of female violence and protective measures. Funding was authorized to pay the cost of testing for sexually transmitted diseases (STDs) for victims of sexual abuse. In the past, funds were not available for the thorough evaluation of sexual abuse victims. The funding of testing for sexual transmitted diseases was a significant protection provided sexual abuse victims.

The other aspect is related to increased safety on college campuses. The hiring and training of campus police is important for proactive prevention of some violent offenses and quick reactive response in reported battering cases. Leading researchers point out that there is significant concern for the safety of co-eds on college campuses. Such offenses are often underreported. However, increased policing ensures a more appropriate monitoring and response to the recurrent female violence problem.

A final provision of the VAWA focuses on gathering crime statistics and protection of battered immigrant women and children. In the former, the Attorney General was authorized to provide grants to local governments to improve the keeping of crime statistics. Crime statistics on domestic battering and sex crimes are important in understanding the depth and scope of the larger issue of female violence. The protection of battered immigrant women and children was an important measure. Both legally recognized and undocumented immigrant families were not accorded recognition and protection by police authorities, prosecutors, and protective agencies. This provision encouraged the implementation of significant funds for prosecution and protective services.

Finally, the VAWA increases criminal provisions for crimes based on gender. The law prohibits interstate domestic violence, which makes it a felony to cross state lines with the intent to injure, harass, or intimidate that person's spouse or intimate partner. In addition, it allows protection against credible threats of violence, repeated harassment, or bodily injury to the person or persons whom the order covers. The victim in a prosecution under the VAWA has the opportunity to be heard regarding the danger posed by the defendant during a pretrial detention hearing. In addition, the VAWA provides for restitution to the victim, regardless of any civil or criminal penalties the law provides. The perpetrator is held liable for the full amount of the victim's losses in the areas of medical services; physical and occupational therapy; necessary transportation, temporary housing, and child care expenses; lost income; and attorneys' fees, plus expenses involved in obtaining a civil protection order.

Significant Reform

The VAWA placed significant emphasis on gender-based victims of violence. The summarized provisions provided important heretofore unavailable protections for female victims of violent crime. The legislation, which was passed as Title IV, sec. 4001–40703 of the Violent Crime Control and Law Enforcement Act of 1994 HR 3355, was signed as Public Law 103-322 by President Bill Clinton on September 13, 1994. The impact of the provisions discussed here served to enhance the

investigation and prosecution of the violent crime perpetrated against women, increase pretrial detention of the accused, impose automatic and mandatory restitution on those convicted, and allow civil redress in cases prosecutors chose to leave unprosecuted.

Several controversial procedures were established within the overall legislation. The VAWA gave gender-based victims of violence a cause of action against their attackers. The stipulated liability included both compensatory and punitive damages. This provision was enacted under the Commerce Clause of the Constitution allowing for the regulation of interstate commerce and the Fourteenth Amendment's equal protection clause. However, the civil rights remedy was struck down by the U.S. Supreme Court in *U.S. v. Morrison* (2000). In a 5–4 decision, the court ruled that the law could not be implemented under the Commerce Clause and the Fourteenth Amendment. Nevertheless, the VAWA stood up and was consequently renewed in 2000 and later years.

There was some opposition to the bill from the American Civil Liberties Union (ACLU). The ACLU was concerned that increased penalties, pretrial detention, and mandatory HIV testing for charged but not convicted offenders violated a citizen's right to privacy and the restitution section was nonjudicious. The DNA provision was removed and the bill was renewed in 2005.

Subsequent Revisions

The VAWA legislation was renewed in 2000 when Congress passed a bill reauthorizing the act for another 5 years. More funding was included for domestic violence programs and new measures against the trafficking of women and children into prostitution. The VAWA was also reauthorized in 2005 and will come up for reconsideration in 2010.

In the interim, in 2007, then-Senator Joseph Biden proposed the International Violence Against Women Act as part of other 2007 legislation initiatives. The measure contains several controversial provisions. One provision amends the Foreign Assistance Act of 1961 to establish in the Department of State the Office of Women's Global Initiatives to coordinate U.S. government efforts respecting international women's issues. A second

provision directs the President to develop a comprehensive strategy to prevent violence against women and girls. The coordinator of the Women's Global Initiatives is directed to ensure that foreign assistance programs incorporate measures to prevent and respond to violence against women and girls. In addition, U.S. training of foreign military and police forces incorporates instruction on the prevention of violence against women and girls.

A third provision directs the department and the U.S. Agency for International Development to assist programs that prevent and respond to violence against women and girls in all humanitarian relief, conflict, and postconflict operations. Finally, a fourth provision reflects the point of view that the United Nations should strengthen its ability to prevent violence against women and girls by U.N. military and civilian personnel. The IVAWA has not yet been enacted into law.

Legacy

The Violence Against Women Act of 1994 and its subsequent revisions reflect community sentiment that the federal system needed to protect the rights of women in domestic battering or sex crime situations. The criminal justice system had long neglected the rights of women placed in violent situations. Furthermore, local prosecutors often failed to prioritize domestic violence with an emphasis on other forms of criminal conduct.

Furthermore, the VAWA was a bipartisan understanding that the federal government needed to take a more active role in combating domestic abuse. Legal systems across the country were not uniform in providing for the needs of women in the event of violent crime. The allocation of the funding and public education programs was instrumental in providing assurance of an adequate response to protecting all crime victims.

VIOLENT CRIME CONTROL AND LAW ENFORCEMENT ACT OF 1994

During the 1980s and the 1990s, the fear of crime was a significant problem for law enforcement in the United States. High on the list of priorities were the War on Drugs, domestic violence, and violent crime. During this time, the ideas of community policing and crime prevention were becoming significant considerations in the arsenal of law enforcement.

As a direct result of the national focus on these priorities, the Violent Crime Control and Law Enforcement Act of 1994 (hereinafter "the act") was signed into law on September 13, 1994. It was the first omnibus crime bill to be enacted in many years and covered a broad range of topics within the field of criminal law. The act was divided into 33 titles. This entry examines those sections that are most germane to the topics in this encyclopedia.

Title I

Title I, Public Safety and Policing, was also named the Public Safety Partnership and Community Policing Act of 1994. The stated purposes of this Title were to (1) increase the number of law enforcement officers directly interacting with members of the community, (2) provide more effective training for law enforcement officers, (3) encourage new innovative programs for the prevention of crime in the community, and (4) encourage the development of new technologies to reorient law enforcement from reacting to crime to crime prevention.

The essential feature of Title I was an authorization for the U.S. Attorney General to make grants to states, local governments, tribal governments, or other public or private agencies to address crime and disorder and otherwise enhance public safety. These grants could be made for hiring or rehiring personnel, training of personnel, or procurement of equipment or technology for the purposes of community policing. Many law enforcement agencies took advantage of these funds to expand their community policing efforts in the years after the act was implemented.

Title II

Title II, Prisons, addressed a wide range of topics directly related to the correctional systems in the states and the Federal Bureau of Prisons.

Acknowledging the serious problem of increasing prison populations and the significant expense of constructing more prisons, the act authorized the U.S. Attorney General to make grants to states to construct, expand, modify, improve, or operate alternative correctional facilities to free space in conventional prisons for violent offenders and to implement truth in sentencing laws. Truth in sentencing laws are laws that mandate the completion of a substantial portion of a prison sentence rather than allowing parole or early release. This authorization specifically included boot camps.

Fifty percent of the available grants were to be given to those states that increased the percentage of convicted violent offenders sent to prison, the average time served by violent offenders, and the percentage of sentences served by violent offenders, as well as those states that had in effect laws requiring violent offenders to serve 85% of their sentences. This requirement was enacted to give effect to truth in sentencing laws. Many states took advantage of these funds to expand their correctional systems in the years after the implementation of the act.

Under Title II, the issue of young offenders was also addressed. The Attorney General was authorized to make grants to state and local governments to develop alternative methods of punishment for young offenders instead of traditional correctional facilities. The suggested alternative methods included, but were not limited to, restitution programs, community service programs, education, job training, and alternative sanctions.

The theory behind those provisions for the modification of corrections systems included, in addition to the goal of saving money and resources, the idea that some classes of offenders were more amenable to less harsh sanctions so as to look more at rehabilitation rather than creating a permanent subclass of repeat offenders. Indeed, the act required that federal inmates had to be making satisfactory progress toward their high school diploma to be credited for their time served. Also, the act established an office in the Department of Justice to support job training and placement programs for

inmates and ex-offenders. However, it is interesting to note that the Congress attempted to limit civil rights claims by prisoners under the Eighth Amendment for overcrowding to those cases where cruel and unusual punishment was inflicted on the inmate.

Title III

Under Title III, Crime Prevention, the Ounce of Prevention Council was established. The duties of the Council included making grants to municipalities, counties, nonprofit entities, tribal governments, schools, colleges, and universities for such crime prevention programs as summer and after-school education and recreation programs, Drug Abuse Resistance Education programs, employment programs, and programs to help with substance abuse, child abuse, and adolescent pregnancy.

Local governments were also eligible under Title III for block grants for programs concerning such activities as (1) education, training, diversion, treatment, and rehabilitation programs to prevent juvenile violence, gangs, and juvenile drug abuse; (2) crime prevention concerning the elderly; (3) the Youth Fair Chance Program; (4) Boys and Girls Clubs of America and visitation programs for abused or neglected children; and (5) juvenile law enforcement services. Title III also provided grants for applicants to develop innovative crime-prevention programs in not more than 15 high-crime areas. Title III also provided grants for the improvement of academic and social development of at-risk children in schools. This section of Title III was also named the Family and Community Endeavor Schools Act. Title III provided various other grant programs concerning certain issues, many related to drug abuse, rehabilitation in prison, and gang resistance. Many of these programs were funded only minimally.

Title IV

Title IV, Violence Against Women, contained several sections. The first subtitle, the Safe Streets for Women Act of 1994, provided for increased prison sentences under federal law for repeat offenders of sexual crimes and for mandatory restitution to victims. Title IV also provided for grants to combat violent crimes against women. The purposes of

these grants included training law enforcement and prosecutorial personnel, expanding enforcement of domestic violence and sexual assault laws, collecting data, and increasing victim services. Title IV, with some exceptions, significantly limited the admissibility of evidence of an alleged victim's past sexual behavior or predisposition in both criminal and civil proceedings concerning allegations of sexual misconduct. Title IV also provided monies to the states for programs involving rape-prevention education programs.

Title IV made it a felony for a person to commit interstate domestic violence or interstate violation of a protection order. This law made it easier to prosecute persons who commit domestic violence or violate protection orders and then cross state lines to escape prosecution.

Title IV also provided grants to states, tribal governments, and local governments to implement mandatory arrest policies in cases of domestic violence. Moreover, the act, in a subtitle named the Civil Rights Remedies for Gender Motivated Violence Act, specifically authorized a civil rights action for compensatory and punitive damages against any person who commits a crime of violence motivated by gender.

Title V

Title V, Drug Courts, provided for the funding and support of drug courts. Drug courts involve the judicial administration and supervision of nonviolent drug offenders rather than sending them to prison.

Title VI

Title VI, Death Penalty, also known as the Federal Death Penalty Act of 1994, presented several new aspects and clarifications to the criminal law and the imposition of the death penalty. Any person who intentionally killed the victim, intentionally caused serious bodily injury that resulted in the death of the victim, intentionally participated in an act contemplating the death of the victim and the victim died, or intentionally engaged in an act of violence knowing of a grave risk of the death of a person and the victim died may be sentenced to death. Also, any person who traffics in illegal controlled substances may, in

certain circumstances, be sentenced to death. The act also provided a list of mitigating and aggravating factors to be considered concerning imposition of the death penalty.

Title VII

Title VII, Mandatory Life Imprisonment for Certain Felonies, concerned what are more commonly known as "Three Strikes" laws. Three strikes laws usually mandate life imprisonment when a person has been convicted of three or more felonies. This part of the act addressed persons charged in federal court. Under this part of the act, any person who is convicted of a serious violent felony and has two or more previous violent felony convictions shall be sentenced to a mandatory sentence of life imprisonment. A serious violent felony was defined as a crime of violence punishable by a maximum of 10 or more years' imprisonment. Also, under this part of the act, any person convicted of a serious violent felony and has one or more serious violent felonies and one or more serious drug offenses shall be sentenced to life imprisonment. A serious drug offense was defined as a drug offense that would be subject to a 10-year mandatory minimum penalty.

Title XI

Title XI, Firearms, was also named the Public Safety and Recreational Firearms Use Protection Act. Its primary component was a ban on the manufacture, transfer, or possession of a semiautomatic assault weapon. A semiautomatic assault weapon was defined as certain specific military style weapons or other weapons that had a combination of such features as a detachable multiple round magazine, a folding or telescopic stock, a pistol grip that extended below the weapon, a flash suppressor, a bayonet mount, or a grenade launcher.

Title XII

Title XII, Terrorism, mandated the new crime of providing material support or resources to terrorists. Material support or resources was defined as including the provision of financial services, lodging, training, safehouses, false documentation or identification, communications equipment, weapons

explosives, personnel, or transportation but was not defined to include humanitarian assistance. There was much criticism of this law as being overly broad and difficult to apply.

Title XV

Title XV, Criminal Street Gangs, increased the penalties for certain violent crimes by persons who were members of street gangs. This law recognized the increasing problem that street gangs were causing in urban areas, especially with regard to the increasing incidence of violence and drugs.

Title XVII

Title XVII, Crimes Against Children, required any person who was convicted of a criminal offense against a victim who was a minor, who was convicted of a sexual offense, or who was deemed to be a sexually violent predator to register with law enforcement agencies for a certain time period or until additional order of the courts. This law was enacted in response to the strong public outcry to protect children from sexual abuse and repeat offenders.

Conclusion

The Violent Crime Control and Law Enforcement Act of 1994 intended to address numerous problems of crime control by the prevention of crime through the creation of various programs and the hiring of an additional 100,000 police officers. Crime prevention was not only addressed through such aspects of deterrence through increased penalties but even more so through programs that actively try to stop crime before it happens.

Through the Office of Community Oriented Policing Services in the Department of Justice, which was formed to implement the Violent Crime Control and Law Enforcement Act of 1994, millions of dollars were disbursed to state, tribal, and local governments and agencies.

Since the enactment of the Violent Crime Control and Law Enforcement Act of 1994, there has been a dispute as to whether the crime prevention and community policing programs initiated by it have been effective. However, there is no dispute that the act has resulted in the hiring of many more law enforcement officers and the

enhancement of community resources and programs for the prevention of crime.

VIRTUAL REPEATS AND NEAR REPEATS

Although it has been known for the last decade that prior victimization is the best predictor of future risk, recent research suggests that future patterns of victimization may be improved by considering the similarity (in terms of geographical proximity or otherwise) of current and potential victims. The ability to predict accurately when and where (or against whom or what) crime will occur has obvious implications for crime prevention and detection. This entry provides an overview of research concerned with virtual and near repeats, which inform this agenda. There is a special emphasis on the techniques employed to identify near repeats and the associated methodological issues. Additional sections deal with the explanations put forward to explain these phenomena, as

well as explain how our current knowledge of the subject can be used to prevent and detect crime more accurately.

Definitions

The concept of *virtual repeat* was coined by Ken Pease, who used it to refer to those crime incidents in which the target is selected on the basis of similarity to a previous victim. For instance, an offender might favor a particular make and model of vehicle to steal because he or she has successfully stolen the same type of vehicle in the past. The particular type of car may be appealing for a range of reasons, including the ease of entry and the profitability associated with its disposal. Other examples of virtual repeats include racial incidents, where the victim is selected on the basis of their apparent ethnicity, burglary of residences with similar physical layouts, and so on.

The term *near repeat* is a special case of the virtual repeat concept. A near repeat occurs when a crime is committed against a target that is geographically close to a previously victimized target. So, whereas virtual repeats involve targets that may be similar in one or more characteristics, near repeats involve targets that are close in space. As with repeat victimization of the same target, the likelihood of a near repeat occurring decays over time so that the increased risk observed to nearby targets decreases dramatically as time progresses. Most research on near repeats has so far focused on residential burglary, although recent studies have extended this to other crime types, such as theft from motor vehicles, street shootings, and even improvised explosive attacks in Iraq.

Identifying Virtual and Near Repeats

Virtual Repeats

The identification of virtual repeats is heavily dependent on the target characteristics and the crime type under study. Often, this information is available within police data sets. For instance, police data usually contain information on the gender, age, and ethnicity of victims; the make, model, and security features of a stolen (from) vehicle; the

type of building being burgled; and so on. However, these fields are sometimes left blank or the information provided is not detailed enough for the researcher's purposes, which makes the study of virtual repeats based on police data difficult.

An alternative is to engage offenders in ethnographic research. Using these techniques, useful information can be revealed about offender targeting strategies and the relative importance they assign to target similarity when making decisions about their offending. One discovery made using this approach concerned an offender who robbed gas stations. This offender revealed that he usually targeted petrol stations from the same chain, as they all had identical floor plans.

Near Repeats

Considerably more work has been completed regarding near (rather than virtual) repeats, and so the methods developed to examine the phenomenon are discussed here. The identification of the near repeat pattern has so far been achieved using techniques developed in the field of epidemiology to detect disease contagion. The simple reason is that, if near repeats occur, then the spatial and temporal distribution of crime should resemble the spread of a disease (i.e., a single incident should be followed by additional occurrences that take place nearby and soon after). The aim of the technique used is to establish whether events are concentrated in time *and* space more than would be expected if crime were simply concentrated in time *or* space.

The Knox Approximation Method

To do this, for a given data set, the spatial and temporal distances between all possible pairs of events (for n events, the total number of possible pairs is $n(n-1)/2$; e.g., a sample of 10 crime events will have 45 possible pairs) are computed and a contingency table is populated to summarize the results. The contingency table summarizes how many pairs of events occur within particular space-time intervals of each other. For instance, in the fictional example provided in Table 1, one pair of events occurred within 100 meters and 2 weeks of each other, five pairs occurred within 100 meters and between 2 and 4 weeks of each other, and so

on. The bandwidths used in the table, although arbitrary, are usually informed by existing research on journey to crime and the time course of repeat victimization. Common bandwidths used in the literature are 100 meters and 2-week intervals.

Once the contingency table has been computed, the observed frequencies in the table can be compared with the frequencies that would be expected if the timing and location of crimes were independent. These expected frequencies are calculated using the marginal totals in the contingency table. Comparisons between the observed and the expected frequencies can then be made and a chi-square test can be performed to determine whether the overall distributions obtained are significantly different from each other. Residuals can also be calculated to obtain statistical test results at the cell level.

If a significant difference is found, then the results of the test can be interpreted by identifying the categories (or cells) in the table that have

higher observed frequencies than would be expected by chance. For a spatiotemporal distribution to be observed (and hence the existence of near repeats in the sample), it would be in the cells depicting the shortest spatial and temporal intervals (i.e., top-left of the table) that these unusually high frequencies should be found. (If unusually high frequencies only occurred, say, along the first row but across the table, then we would just have crime that is concentrated in *space* but not time [i.e., a stable hot spot]; in the same way, if unusually high frequencies occurred along the first column, then all the way down the table, we would have a purely *temporal* concentration, in other words, a pattern where a limited-time crime wave has taken place throughout the geographical area.)

There is an important problem with this approach, however. One assumption of the chi-square test is that the observations will be independent from each other. For the analysis of pairs of events, this assumption will be violated.

Table 1 Example of Knox table, which shows the observed frequencies for different spatial and temporal distances between pairs of events ($N = 10$)

		<i>Time Apart (weeks)</i>							<i>Total</i>
		$0 \leq t < 2$	$2 \leq t < 4$	$4 \leq t < 6$	$6 \leq t < 8$	$8 \leq t < 10$	$10 \leq t < 12$	$12 \leq t < 14$	
<i>Distance Apart</i>	$0 \leq d < 100$ m	1	5	0	0	0	0	0	6
	$100 \leq d < 200$ m	2	2	2	0	0	0	0	6
	$200 \leq d < 300$ m	1	1	2	0	0	0	0	4
	$300 \leq d < 400$ m	0	3	0	0	0	0	0	3
	$400 \leq d < 500$ m	0	0	1	0	0	2	1	5
	$500 \leq d < 600$ m	1	0	0	0	0	2	1	4
	$600 \leq d < 700$ m	0	0	0	1	1	0	0	2
	$700 \leq d < 800$ m	0	0	0	4	2	2	1	9
	$800 \leq d < 900$ m	0	0	0	1	4	0	0	5
	900 m and above	0	0	0	0	0	1	0	1
Total		5	11	5	6	7	7	3	45

Monte Carlo Approach

An alternative approach is to use a Monte Carlo resampling method to compute the expected frequencies. This is done by shuffling the data by randomly allocating the actual dates to crimes and then recomputing the contingency table. A full permutation for a sample sized n would be $n!$, so even for small data sets, the number of permutations can be incredibly high (e.g., for a sample of just 450 crime events, we would have $1.73 \times 10^{1,000}$ permutations). A Monte Carlo simulation is thus used to select random samples from all possible permutations to generate the expected frequencies. Whenever an observed frequency is higher than the expected frequencies generated in 99% or more of the simulations, a conclusion can be made that this difference is significant at the .01 level.

Other Methodological Considerations

With either approach, however, outstanding methodological issues remain that mainly relate to edge effects and to physical and social boundaries. *Edge effects* occur as a result of dealing with a limited geographical area. This means that the “full picture” is not available for crime events close to these boundaries, so that nearby crimes can be overlooked. These effects are most problematic when the boundaries do not reflect the physical or social geography of the area (e.g., a better boundary would be one that has been imposed along the course of a river or separating areas that have different ethnic or socioeconomic makeups). This is because *physical and social boundaries* can have an effect on how crime disperses, hence the importance of taking these variables into account when carrying out this type of analysis.

Subsequent methodological issues originate from the sometimes poor quality of location data within police data sets. Often, address information is missing, incomplete, or recorded in a nonuniform way, which leads to the removal of large amounts of data prior to analysis and to difficulty in identifying near repeats accurately. In the case of crimes where the victim is not present at the time, there is the additional potential problem of dealing with large time windows, which refers to the amount of time when the offense could have occurred (i.e., from when the target was last seen

prior to victimization to the time when the crime was discovered).

Explaining Virtual and Near Repeats: Flag or Boost?

When attempting to explain the occurrence of virtual and near repeats, two accounts used to explain repeat victimization can be employed: flag and boost accounts. According to the *flag* account (or *risk heterogeneity*), a target is victimized repeatedly because of the specific characteristic of this target, which make it permanently vulnerable. According to the *boost* account (or *event dependency*), repeats (either virtual, near, or simple repeats) are conditional on the original event and involve the same offender. For instance, once an offender has committed a burglary in a particular area, he or she will be likely to return to the same area and commit additional burglaries (because the individual has become familiar with the area as a result of the original burglary).

The boost account is consistent with routine activities and lifestyle theories. An analogy has also been drawn with the ecological concept of optimal foraging, where animals are thought to forage actively in one area for a limited period of time and then move onto the next, thus maximizing rewards while minimizing effort and the likelihood of being captured by a predator.

Recent studies have provided support for the boost hypothesis, by demonstrating that crimes that occur close in space and time are significantly more likely to have been committed by the same offender (as opposed to those that are not clustered spatiotemporally).

Preventing Virtual and Near Repeats

Where virtual or near repeats are identified, this knowledge can be used to guide crime prevention efforts. For instance, if a particular make and model of vehicle is found to be repeatedly victimized, then measures could be taken to minimize its attractiveness to offenders by improving its security features. Awareness of near repeats has also been used to develop methods of crime forecasting, which have been shown to be more accurate than the traditional hot spot maps currently used by the police. Research concerned with the

near repeat phenomenon is in its infancy, but the application of the findings has considerable potential.

W

WAR CRIMES

War crimes are offenses against the laws of war, more recently termed the laws of armed conflict or humanitarian law. This entry examines four key issues: (1) What are war crimes? (2) Where does the notion come from? (3) What do we know about war crimes? and (4) What can we do about them?

Definitions

The laws of war can be separated into two types: (1) laws concerning the regulation of methods and means of combat, such as prohibition of the use of poisonous gases, which is stressed in the 1907 Hague Convention, and (2) laws of armed conflict concerning the protection of human beings, such as the 1949 Geneva Conventions and Protocols. The Geneva Convention can be broken down into rules pertaining to the protection of military personnel or combatants and those pertaining to the protection of civilians. The violation of both types of law, namely the methods of combat as well as the protection of people, can produce victims.

Victimologists, however, prefer a victim-focused definition of war crimes, such as the one found in the 1985 UN Declaration of Basic Principles of Justice for Victims of Crime and Abuse of Power. According to Article 18 of the UN Declaration, victims are “persons who, individually or collectively, have suffered harm, including physical or mental injury, emotional suffering, economic loss or substantial impairment of their fundamental

rights, through acts or omissions that do not yet constitute violation of national criminal laws but of internationally recognized norms relating to human rights.”

Based on this definition, victims include both individuals and groups. Collective victims are created when violent actions are directed at a specific population, for example, an ethnic, ideological, or religious group. This definition is sufficiently broad that it includes both direct and indirect victims. Direct victims are those who have suffered the direct effects of the violence. These are the individuals who were killed, tortured, raped, and so on. Indirect victims are those who are linked to direct victims in such a way that they too suffer because of that link, for example, the victim’s family.

Most war crimes occur by military personnel. However, any person, including civilians, can be a perpetrator. Individuals, acting in either an official capacity (e.g., police) or a private capacity, can commit war crimes. However, victim and offender groups are not mutually exclusive: A person can be a victim at one time and an offender at another time.

By definition, war crimes can only occur within the context of a war or armed conflict. However, sometimes it may not be easy to establish whether a conflict is a war despite obvious serious violations of human rights. Crimes against humanity refer to many of the same types of offenses against human beings, such as torture, rape, and murder. But unlike war crimes, crimes against humanity can take place in times of peace as well as in times of war.

Historical Perspectives

One of the first efforts to regulate and humanize armed conflict originated in the United States. In 1863, in the context of the American Civil War, Abraham Lincoln signed General Orders No. 100, also known as the Lieber Code, which was later adopted as International Law at the 1907 International Peace Conference in Copenhagen and became the basis for the Hague Convention IV respecting the laws and customs of war on land. The Lieber Code addresses both the methods and means of combat as well as the protection of human beings, including civilians. Although the Code prohibits unnecessary violence against private citizens, Article 21 specifies that “any citizen or native of a hostile country is thus an enemy.” This perspective continued into the Second World War, during which citizens of German, Italian, and Japanese origin, who were living in North America, were interned.

The first Geneva Convention was codified in 1864, inspired by the work of Swiss businessman Henry Dunant. This first Convention addressed the protection of the wounded and sick. After the atrocities of World War II, in 1949 the four Geneva Conventions were adopted: The first deals with the wounded and sick, the second addresses the sick and wounded at sea, the third concerns prisoners of war, and the fourth focuses on civilians. The Convention on civilians demonstrates a drastic change in perspective with regard to the treatment of civilians during wartime. Instead of viewing all members of the opposing group as the enemy, the Convention stresses humane and unbiased treatment of all persons taking no active part in the hostilities as well as members of armed forces who have laid down their arms and those unable to fight, for example, due to sickness or wounds (Article 1). Persons protected by the Convention are those who, at a given moment and in any manner whatsoever, find themselves, in case of a conflict or occupation, in the hands of a Party to the conflict or Occupying Power of which they are not nationals (Article 4). Breaking with the past, the Convention specifically puts strict limitations on the internment of foreign nationals (Article 42). In addition, it offers special protection to women, in particular against rape, forced prostitution, or any form of indecent assault (Article 27).

International humanitarian law is not a cohesive body of law. Instead it is a category of separate legal principles and rules that come from a variety of different sources of law, such as international treaties, conventions, and customary law. Thus, beyond the Geneva and the Hague Conventions, one can find articles that are relevant to international humanitarian law in many other sources, including the UN Convention on the Rights of the Child.

The Consequences

Although it is hard to find precise statistics on the number of victims of war crimes, Amnesty International estimates that 70% of the casualties in recent conflicts have been noncombatants and most of them are women and children.

Violent conflict causes terrible suffering to all people, but it also has a different impact on men and women, because victimization is partly gender specific. Traditionally, men are more likely than women to be involved in fighting and to be killed or wounded. However, in recent years, women have joined the ranks of several armies, such as Latin American guerrilla forces.

Women are subject to double victimization. Mass rape of women belonging to an enemy group has been practiced as a means of assaulting the role and identity of the men in the group as providers and protectors of the family and the group. In other cases, women are forced to “marry” men either as a strategy of creating alliances or to satisfy the needs of men isolated from their families during war. For example, girls may be forced into the army, not as soldiers, but as sexual slaves for the soldiers. Moreover, as a result of their victimization, women may also be at greater risk of rape, abuse, and stigmatization by members of their own community. Their own communities may reject the victims along with their illegitimate children.

Differences in rights and entitlement can be of great importance in determining how conflicts affect men’s and women’s livelihoods, for example, if women are not registered as individual citizens or they are not registered (and recognized) as owners of land, houses, assets, and tools. This can make it difficult for women to protect their resources and to make claims for compensation and other kinds of assistance and adds to their economic and social vulnerability.

Although sexual assault predominantly affects women, it is important to recognize that men can also be the victims of sexual assault and sexual torture. The sexual assault and sexual torture of male prisoners of war has been well documented. Sexual torture includes a variety of behaviors ranging from forced nakedness to rape. Another example of crimes that target men is when opposing groups murder or permanently injure young men simply to prevent them from possibly fighting one day.

Children are the most defenseless victims in war, and with the changing nature and proliferation of conflicts after the end of the cold war, children have increasingly become victims of warfare. Two groups are particularly vulnerable: refugee children and child soldiers. Research on the impact of war on children shows that children may suffer a wide variety of stress-related symptoms, including posttraumatic stress disorder (PTSD), depression, anxiety problems, behavior problems, and social impairment. Although the prevalence varies between studies, it is clear that children can be strongly affected by war and that traumatic experiences have a cumulative impact. If, for example, in addition to having witnessed the atrocities of war, children are also displaced and living in refugee camps, they are more likely to suffer PTSD than children who have similarly witnessed war but continue to live at home in villages and cities. Moreover, these problems can persist for many years. Research with adults who experienced World War II as children reveals that the negative impact of war can last a lifetime.

War crimes can have such a profound effect on victims that not only will they carry the scars of their victimization for the rest of their life, but their children may as well. Studies have shown that the children and sometimes even the grandchildren of victims can suffer trauma even though they were not born yet at the time of the actual victimization. Hence, a distinction can be made between first- and second-generation victims.

Because war crimes may target specific social, religious, or ethnic groups, members of that group or community may also feel victimized regardless of whether they themselves experienced any direct victimization. Social psychologists, like Henri Tajfel, argue that identity is defined in a social context and that people have a personal identity, which is unique to them, as well as a social identity,

which is based on their membership in social groups. Feeling that their social identity has been targeted, members of the targeted group may experience a wide range of emotional reactions, including anger, fear, sadness, feelings of powerlessness, vulnerability, and suspicion of others. For example, the victim-witnesses who testified at the International Criminal Tribunal for the Former Yugoslavia often wanted to speak not only about the wrongs they personally suffered but also about those endured by their social group.

Besides the direct victims and their families, humanitarian aid workers who assist traumatized populations may also experience emotional, cognitive, and physical consequences. This is commonly referred to as vicarious victimization.

Responses and Prevention

Although victims may have rights in international humanitarian law, recognition of rights and the right to claim those rights are two different things. In general, there are three different ways to respond to war crimes: (1) amnesty, (2) criminal prosecution, and (3) truth commissions.

Amnesty is the act of an authority by which pardon is granted to a large group of individuals. It means that as a group, the victims and offenders turn the page and move on. Although there may be a recognition that crimes were committed, there are no consequences for the offenders. And although amnesty may help a country place the tragedies of war behind it and embrace the future, it does not help victims or the society come to terms with what happened. Indeed, research with victims suggests that impunity augments the victims' suffering.

Criminal prosecution of war criminals puts an end to impunity and recognizes the injustice committed against the victims by the offenders. The first international criminal court was the Nuremburg Tribunal, which was established in 1945, in order to try the top Nazi officials for the crimes committed during World War II. One year later, the Tokyo Tribunal was established in order to try the top Japanese officials for the crimes committed by the Japanese during the war. These were temporary, ad hoc tribunals, which were dismantled once they had tried and sentenced the accused. Almost 50 years after the Nuremburg and Tokyo trials, the UN Security Council created two more ad hoc tribunals.

In 1993, the *International Criminal Tribunal for the Prosecution of Persons Responsible for Serious Violations of International Humanitarian Law Committed in the Territory of the Former Yugoslavia since 1991* (Resolution 827) was created. Two years later, in 1995, the International Criminal Tribunal for Rwanda was created, in response to the genocide in that country in which an estimated 800,000 people were murdered. Finally, in 1998, the international community adopted the Rome Statute of the International Criminal Court (ICC), which permitted the creation of a permanent international criminal court. The International Criminal Court, which is located in The Hague, the Netherlands, entered into force on July 1, 2002.

In addition to the ICC, nation states maintain the right to prosecute their nationals for war crimes. The complementarity principle of the ICC ensures that nation states are considered the first appropriate forum for trying war criminals; however, if the nation is unable or unwilling to prosecute, the ICC can step in. For example, if Canadian soldiers committed war crimes while on a UN mission, one would expect the suspects to be tried by a Canadian military tribunal. Only if Canada was unwilling or unable to try them could the case go to the ICC.

Although criminal prosecution holds offenders accountable, victims often feel excluded or forgotten in criminal procedures. In the ad hoc tribunals, the victims' only role was that of witness to a crime. This is in violation of the Declaration of Basic Principles of Justice for Victims of Crime and Abuse of Power, which was adopted by the United Nations in 1985 and calls for "national and international measures in order to secure the universal and effective recognition of, and respect for, the rights of victims of crime and of abuse of power" (Article 1). A distinguishing feature of the ICC is that, unlike its predecessors, the ICC recognizes victims' rights to participation and reparation. To enforce their rights, victims can be represented in the criminal justice process by a lawyer.

Another unique feature of the ICC is the introduction of the Trust Fund for Victims. The Trust Fund was established as an independent body to complement the Court's reparations function to benefit victims of crimes within the jurisdiction of the Court and their families. The main functions of the Trust Fund are to collect voluntary contributions, fines, and forfeitures; implement reparation

orders from the Court; and use voluntary contributions to provide assistance to victims independent of the reparations process.

Despite the tremendous progress made by the ICC with respect to victims' rights, some authors argue that criminal justice procedures may act as an obstacle and hinder reconciliation between groups or, at best, not affect intergroup relations. After all, in a mass conflict where everyone in the society is affected in one way or another, you cannot simply imprison half the population. At one point, society has to move beyond the victimization and work on its future; schools need to be built, business needs to flourish, and farming needs to resume. For survivors of war crimes, justice encompasses more than criminal trials. It means returning stolen property, locating and identifying the bodies of the missing, capturing and trying all war criminals, securing reparations, ensuring victims' protection and safety, providing their children with good schools and teachers, helping those traumatized by atrocities to recover, and commemoration, as well as reintegration and reconnection of victims in their community.

A third possible response to violent conflict is the creation of a Truth Commission. Placed on a continuum, Truth Commissions are situated in between total amnesty and criminal prosecutions. Victims are given a voice in Truth Commissions, which focus on uncovering the truth about what happened and, as such, can help victims and the society as a whole to come to terms with the atrocities committed in the past. Unlike criminal prosecutions, Truth Commissions are not adjudicative and do not punish offenders. Truth Commissions may be particularly salient in the case of civil war, where rival groups have to find a way to live together after violent conflict.

It is important to note that the three paths outlined here are not mutually exclusive. Any combination is possible, for example, beginning with a Truth Commission followed by criminal procedures, or the reverse, or criminal justice procedures for the top officials and amnesty for the foot soldiers.

WHITE-COLLAR CRIME

Within the discipline of criminology, white-collar crime is one of the more challenging forms of law violations to operationalize. Edwin Sutherland, the sociologist who coined the term in a 1939 presidential address to the American Sociological Society (ASS), defined white-collar crime as “a crime committed by a person of respectability and high social status in the course of his occupation.” In his influential 1949 text, *White Collar Crime*, Sutherland specifies that crimes committed by business managers and executives are the primary subjects of this field of study. Likewise, the sociologist, E. A. Ross, who reportedly had the greatest direct influence on Sutherland, popularized the typology of the “criminaloid”: the exploitive businessman whose pursuit of profit maximization lay hidden beneath his respectable status and pious demeanor.

Although the earliest attempts to define white-collar crime tended to focus more on the psychological or social-psychological characteristics of these offense types and offenders (relative to structural, organizational, and/or cultural explanations), many of the key attributes noted by Ross and Sutherland—particularly the offender’s abuse of power and trust within his or her occupational context—are central components of white-collar crime studies today. In 1973, Marshall Clinard and Richard Quinney provided one of the most central definitional contributions to white-collar crime when they made the distinction between occupational crime and corporate crime. The former refers to a law violation for personal gain committed by an employee of any status level, and that is made possible through his or her engagement in a legitimate occupation. The latter refers to a law violation by higher-level corporate officers whose illegal behavior is committed on behalf of the corporation itself. Corporate crime also includes illegal acts committed *by* the corporation.

Characteristics of Offenders, Offenses, and Typologies

Despite the definitional advances over the last 70 years since Sutherland's landmark ASS presidential address, no singular, universal, agreed-upon definition of white-collar crime currently exists. Instead, the term is often discussed typologically where there is generally more widespread agreement as to its offense and offender characteristics. As with traditional forms of law violations, white-collar offenders are disproportionately male. However, with respect to other demographic comparisons, white-collar criminals are much more likely to occupy a middle- or upper-class background relative to conventional offenders. Also in contrast to conventional law violators, white-collar offenders tend to be middle-aged or older, have more formal education, are more likely to be married with more stable home lives, and have greater social networks including community groups and church affiliations.

Personally and professionally, the masks of legitimacy and respectability distinguish the white-collar offender from most conventional offenders. Through acquiring occupational positions of power, responsibility, influence, and trust, the white-collar offender opportunistically exploits the deficits or weaknesses—be it in his company, corporation, industry, or law—for (personal or organizational) financial and/or political gain.

Characteristics of white-collar offenses generally include deceit, concealment, and, as stated, violations of trust, responsibility, authority, and/or power within the course of one's occupation. Motivations for committing these offenses center on enhancing one's personal, organizational, or political power, influence, or financial gain. On average, white-collar offenses typically require greater autonomy, planning, sophistication, occupational access, and specialized knowledge compared with most conventional crimes. White-collar offenses also carry less risk in terms of being so labeled, detected, arrested, prosecuted, convicted, and criminally sanctioned.

White-collar offenses may include a violation of criminal, civil, or administrative law or may border the edges of legality—as in the case of unethical or immoral occupational conduct—often labeled white-collar deviance. The latter term recognizes that a white-collar offense need not be

criminally codified or sanctioned to cause significant physical, financial, or moral harm. The tobacco industry, for example, manufactures a legal product responsible for contributing to more than 400,000 American deaths annually. Despite the fact that cigarettes are highly addictive, carcinogenic, legal drugs, they are not regulated by the U.S. Food and Drug Administration, which regulates other legal drugs.

The centrality of harm with respect to white-collar crime is evident in each of its many typologies, including corporate, occupational, governmental, finance, enterprise, entrepreneurial, avocational, and technological crime. Major varieties and examples of white-collar crime include *fraud*—false advertising, consumer fraud, financial fraud, tax evasion, and professional fraud; *labor violations*—workplace safety, health, and compensation violations, violations of privacy and the right to organize; *manufacturing violations*—manufacturing unsafe products or illegally emitting or dumping industrial pollutants into the air, water, or land; *governmental abuses of authority*—(*crimes of commission*) state sexual violence, political bribery, political corruption, and (*crimes of omission*) failure to adhere to agency/administrative orders, or to produce or report information when there is a legal obligation to do so; and *illegal or unfair business practices*—commercial bribery, industrial espionage, trademark, copyright, and patent violations, antitrust law violations (prohibiting monopolies), and Racketeer Influenced and Corrupt Organizations legislation (targeting organized crime).

Prevalence and Costs

Even greater than the task of defining white-collar crime is the challenge of locating the true prevalence and costs associated with these many offense types. Unlike the Department of Justice's Uniform Crime Reporting (UCR) Program and the National Crime Victimization Survey, which mostly collects data on conventional violent and property crimes, no nationwide, systemic governmental data collection exists for all of the varied forms of white-collar crime. Although the FBI's UCR Program (in its Part II category) does collect some data on white-collar crime as does the National Incident-Based Reporting System, the offense types measured are

primarily lower-level occupational or avocational offenses; no data on corporate or governmental crime, for example, are included. Similarly problematic is that both of these governmental databases rely on data reported by state, county, and municipal law enforcement agencies. Federal agencies provide the lead role in white-collar crime enforcement; yet no federal agency data are reported to the UCR Program.

Nevertheless, the FBI and the Association of Certified Fraud Examiners estimate that white-collar crimes cost the United States between \$300 billion and \$660 billion each year, respectively. In comparison with white-collar crime costs, the Sourcebook for Criminal Justice Statistics (which uses an average loss figure per incident) estimates that annual total losses from all property crimes are about \$15 billion; the FBI estimates these losses at approximately \$17 billion. Despite the methodological challenges associated with measuring direct costs (i.e., victims' losses), indirect costs (i.e., higher taxes, increased cost of goods and services, higher insurance rates, and residual economic costs), and physical costs (i.e., personal injury and loss of life), most empirical estimates from governmental, academic, and organizational sources find that the economic costs of white-collar crime are significantly higher than the costs of all conventional "street crime" combined. Perhaps most striking is that even a single white-collar crime case or event can dwarf the economic losses from all recorded property crimes in a single year. The savings and loan scandal of the 1980s, for example, has estimated losses between \$300 billion and \$500 billion. The more recent losses resulting from the corporate criminal conduct of Enron are estimated to reach between \$50 billion and \$60 billion.

Victim Impact

In addition to white-collar crime's greater financial costs, these offense types (most of which can be classified as corporate crime or corporate violence) far exceed conventional street crime with respect to loss of life, injury, and illness. As of this writing, the FBI estimates that close to 17,000 persons are murdered each year in the United States. In contrast, more than 12,000 Americans are killed each year because of unnecessary medical operations

alone. In the workplace, the Occupational Safety and Health Administration (OSHA) reports that 6,000 American workers are killed by occupational injuries each year, 56,000 die from occupational diseases contracted from their work, and 4 million are injured on the job. In the home, the Consumer Product Safety Commission estimates that 27,100 deaths and 33.1 million injuries each year are caused by consumer products.

Similar to the occupational (medical) malfeasance that victimizes patients, the operation of unsafe and unhealthy workplaces that victimize employees and the manufacturing of defective products that victimize consumers, the production, management, and disposal of toxic chemicals by corporate polluters victimize residents with devastating effects on human, animal, and environmental health. For example, the American Cancer Society estimates that 2% of the 556,902 annual American cancer deaths result from air pollution alone. More liberal estimates that count annual deaths from exposure to toxic air, land, and water pollution place the estimate at closer to 200,000. Despite the documented harms associated with these hazards, however, only a fraction of the hundreds of thousands of chemicals in commercial production are presently regulated by the Environmental Protection Agency.

As of this writing in early 2009, the largest governmental bailout (to date) was not of a single corporation but of some of the largest corporations in the mortgage, insurance, banking, and auto industries. The largest portion of the bailout went to the financial industry where widespread corporate-state malfeasance in the mortgage, banking, and insurance sectors have victimized the global and national economy (as well as its member taxpayers) on a scale not seen since the Great Depression. The level of illegal behavior (specifically corporate fraud) responsible for causing many of these spectacular business collapses is not yet fully appreciated.

In the mortgage industry specifically, the FBI has reported thus far that 80% of the fraud losses known to them involve collusion or collaboration between industry insiders. Better known are the quasi-legal (albeit often unethical and harmful) corporate-state practices that allowed the financial sector to dominate more than 35% of overall U.S. corporate profits. Many analysts point to a variety

of governmental factors, including a long-standing buildup of Securities and Exchange Commission deregulation, nonenforcement, and political and legislative influence by financial industry lobbyists that made this “financialization” of the economy possible. As one example, the nonenforcement rules against predatory lending by mortgage companies and banks fueled short-term thinking as well as the excessively high-risk and unstable financial practices that eventually led to the housing crisis of the late 2000s.

The financial industry’s ability to privatize profits and socialize risk is nothing new. For decades, the Treasury Department, Federal Reserve Board, and global lending institutions like the International Monetary Fund have historically enabled “moral hazards” whereby reckless lending and insuring practices by big banks and insurers is met with limited corporate liability, government guaranteed deposits, and government aid packages. As of mid-March 2009, the U.S. government has provided four bailouts to the nation’s largest underwriter of industrial and commercial insurance, American International Group (AIG). The governmental concern regarding “systemic risk” to other financial markets has allowed governmental stewards of the economic and financial system to continue the bailout process for as long as is necessary. Arguably, by externalizing the risks and costs associated with such reckless lending and insuring practices, the financial industry (with great assistance from the State) has learned via both positive and negative reinforcement that taxpayer-funded rescue packages are the new recourse for corporate and industrial malfeasance.

Governmental Responses

In the United States, the first major federal laws regulating and criminalizing white-collar crime emerged in the late 1800s, during the height of the American industrial revolution. Not coincidentally, case law during this time also granted corporations the same rights as “natural persons” in the landmark U.S. Supreme Court case, *Santa Clara v. Southern Pacific Railroad* (1886). The concept of corporate personhood has created unique challenges with respect to criminally prosecuting many white-collar crime cases insofar as it is exceptionally difficult to demonstrate organizational criminal intent. As such, the overwhelming majority of white-collar

crime prosecutions involve individual offenders or individuals engaged in business as an organization; corporate criminal prosecutions are still rare. Other factors limiting white-collar crime prosecutions include class biases that favor white-collar offenders, and insufficient staff and budget resources required for prosecuting these criminal cases that are generally more labor intensive and sophisticated.

Conversely, civil and administrative laws emphasize strict liability, alleviate the *mens rea* burden required of prosecutions, and allow for a more specialized approach to regulating various organizational and occupational practices and behaviors. Similar to the resource issues constraining federal white-collar crime prosecutions, most federal regulatory agencies are grossly understaffed and underresourced, face enormous industrial as well as congressional pressures, and are often expected to do much with little. As a prototypical example, OSHA has approximately 1,000 compliance safety and health officers nationwide to inspect 7 million job sites and protect 115 million workers. On average, only about 2% of these job sites are inspected annually. As with many other regulatory agencies whose purview is largely administrative and civil law, OSHA can refer cases to the Department of Justice for federal prosecution, but it rarely does so in practice. In the case of willful occupational safety or health violations that cause an employee’s death, the maximum penalty for an employer under federal law is 6 months in jail—a misdemeanor—which under any other type of victim–offender relationship would ordinarily warrant a manslaughter charge.

Since the corporate scandals of the early 2000s, the United States has passed the Sarbanes-Oxley Act (SOX) of 2002, which with mixed results has sought to increase corporate governance and accountability, enhance auditor independence, strengthen internal controls, and improve financial disclosure for publicly traded companies. Also after the passage of SOX, the U.S. Sentencing Commission dramatically increased white-collar crime sentences for several offense types. Unfortunately from the vantage point of the deterrence doctrine, the new Sentencing Guidelines do not include fine provisions for many corporate and governmental crimes involving environmental pollution; food, drug, agricultural, and consumer product violations; civil rights violations; and

administration of justice violations (e.g., contempt, obstruction of justice, and perjury). Likewise, despite the enhanced penalties for certain white-collar crimes, the sentencing disparity between conventional and white-collar offenders remains substantial. On average, white-collar offenders are far less likely to be sentenced to prison upon conviction, and they receive far shorter prison sentences than traditional criminal offenders. To date, white-collar criminals comprise less than 2% of the nation's federal correctional population (where most white-collar offenders are sentenced), and no white-collar offender has ever been sentenced to death for his (or her) crime.

Policy Recommendations for Curbing White-Collar Crime

Responding to white-collar crime is an enormous task that requires a solid understanding of its many typologies, characteristics, contexts, victims, and offenders. Such an understanding requires the collective efforts of an informed social movement involving consumer, public interest, labor, environmental, and independent media groups in concert with academic, government, and business leaders committed to transparency and accountability in economic practices and decision making. Among the suggestions for reform are the creations of a white-collar crime sourcebook and national database to compile all of the varied white-collar crime violations, characteristics, and criminal justice system responses, in a consistent, accessible, and easily identifiable format. Such a database could include information on corporate criminal convictions, settlements, and grievances, which could be used by policy makers, attorneys, judges, journalists, activists, researchers, regulatory bodies, shareholders, and any other stakeholder concerned about curbing white-collar crime. Likewise, other additional reporting mechanisms could be initiated, such as an annual crime report similar to the FBI's UCR Program for white-collar crime. In addition, the National Incident-Based Reporting System could expand its category of white-collar crime violations to include more corporate and governmental crimes.

As corporate crime is arguably the most consequential form of white-collar crime, some critics advocate the abolition of corporate personhood

and revocation of their corporate charters for corporations convicted of wrongdoing. More generally, regulatory enforcement and compliance efforts could be initiated that build on the internal compliance efforts that companies have, as well as the ethical evaluations that managers make in informing their business decisions.

WITNESS ASSISTANCE PROGRAMS

Witnesses are often critical for the investigation and prosecution of offenses because they can usually identify the offender and the offense he or she committed, which are the two most important factors for a successful prosecution. This is illustrated by a survey of 159 police officers who were asked the question, "How often do witnesses provide the major leads for an investigation?" Eighty-seven percent said "normally," "almost always," or "always." However, several factors can limit the impact of witnesses. Witnesses may not come forward to the police in the first place, they may decline to give evidence or attend court, or they may give poor-quality evidence. For these reasons, many witness assistance programs have been developed. Because witnesses providing accurate evidence in court are essential

to achieving justice, witness assistance programs can help achieve this at each stage from the initial reporting of the crime, to pretrial, to the trial itself and afterward.

Pretrial Programs

One problem with regard to witnesses and their willingness to participate in the criminal justice process is witness intimidation. Warwick Maynard found that on high-crime housing estates in the United Kingdom, 13% of crime reported by victims and 9% by witnesses led to subsequent intimidation. Intimidation also prevented many from reporting in the first place; 6% of victims and 22% of witnesses did not report for fear of intimidation. Intimidation may be even higher for certain vulnerable witnesses such as victims of rape and child sexual abuse. A recent survey suggested that 53% of vulnerable witnesses experienced some form of intimidation, usually from the defendant or the defendant's family. For intimidation, some programs have used the police to target those who are involved in the intimidation. One study indicated that the police intervention was successful about half the time, whereas another increased the number of witnesses giving evidence in court by 19%. For more extreme forms of intimidation, several countries have Witness Protection Programs, which may involve moving the witnesses and their family and even giving them a new identity. One simple way of improving the motivation of witnesses, and in turn their participation in the criminal justice system, simply involves treating witnesses with respect and understanding witness motivations for giving evidence. Research indicates that witnesses are usually motivated to give evidence to protect others and themselves, to make sure the truth comes out, and so the offender can be punished. Many police services nowadays put much more emphasis on motivating witnesses and victims and on identifying their needs, particularly for vulnerable witnesses, than was the case in the past.

The delay between witnessing or being the victim of a crime and giving evidence in court can be particularly upsetting for prospective witnesses and adds to psychological distress. This seems to be especially the case with children and those giving evidence against a family member. Some programs

have sought to ameliorate these problems via the videotaping of evidence or the provision of counseling. Recent legislation in England and Wales, Australia, and some parts of the United States has made provision for many vulnerable witnesses to give an initial account in court via a prerecorded videotape of their evidence. This process has several advantages. As the evidence is given as soon as a potential crime is disclosed, this means memory decay is minimized. In addition, if counseling is provided subsequent to the initial evidence being provided, it is less likely that the evidence may be contaminated by the therapeutic process or for such allegations of contamination to be made in court. Finally, if the account is videotaped when allegations are made, then the interviewer's questioning can be observed and potentially leading and distorting questions may be identified. Counseling is permitted in some jurisdictions. Often this is tightly controlled by the witness assistance program to ensure that the witness's account is not distorted by the process and that the process is clearly fair. This can be achieved by maintaining detailed notes about what is covered, and the therapist can concentrate on behavioral symptoms rather than on the alleged crime itself.

The prospect of giving evidence can be a daunting task. Many witness assistance programs seek to reduce witnesses' concerns and to improve witnesses' performance through familiarization of the witness with the court and court procedures. This may include precourt visits, videotapes and DVDs of what happens in court, and a host of other methods. For instance, several booklets, including pop-up books for children, cover what will happen in court. Any concerns the witness might have, or special needs they might have, can be assessed at this time with either a formal or an informal assessment. For example, the witness may be concerned that he or she will meet the defendant in the waiting room before going into court. Such fears can be dispelled by providing information about the separate waiting rooms (where applicable) provided for witnesses. Other "special measures" to help the witness provide evidence can be discussed at this point with the witness. Finally, witnesses often need practical support with day-to-day issues, which might include transport to the court and child care for dependent children. Of course, a key issue here is

identifying those who are in need of assistance, and there do seem to be some problems in some areas with officers and prosecuting authorities not recognizing those who are most vulnerable and in need of support and in coordinating this support.

In Court

Several schemes assist a witness in the court itself. These are typically tailored to start as soon as the witness arrives, indeed often before to ensure the witness is comfortable coming into the court buildings in the first place. One way of doing this is via a support person, sometimes called a victim-advocate, who waits with the witness prior to the court appearance and often goes into the court itself. Recently, several initiatives have sought to enhance the quality of the evidence that witnesses give via "special measures." Perhaps the most useful of these is the provision of closed-circuit television (CCTV) or the playing of previously recorded evidence, as mentioned. The main reason for the use of these procedures is that the witness does not have to give evidence in a crowded courtroom. Many adults from the general population find talking in front of large audiences about banal issues difficult; however, when the topic is more stressful, as in the case of rape or child abuse, and the witness is vulnerable, this problem is exacerbated. Another advantage of presenting evidence via video or CCTV means that the witness does not have to meet the defendant directly. Research indicates that presenting evidence in this way is effective. In one survey, 98% of those giving video evidence felt that they had the opportunity to say all they wished compared with only 53% of those in open court. Nevertheless, in some jurisdictions, these procedures may not be available because of the defendant's right to confront his or her accuser.

One of the most critical influences on the quality of witness evidence is the way in which witnesses are questioned. Research indicates that the questions that lawyers ask are often difficult for witnesses from the general population to understand and are particularly problematic for vulnerable groups such as children and people with intellectual disabilities. Most questioning in court is closed, and this is especially the case in cross-examination, meaning that the witness's account is

often constructed by the lawyer rather than given in the witness's own words. The influence of question type can be understood in terms of the different cognitive and social demands of different question formats. For more open questions, the task is to tell the interviewer what the witness can remember by relying on his or her own memory. For more specific, closed questions, the task changes to one of providing the interviewer with what he or she wants the witness to remember that the witness may not be able to recall. If witnesses cannot remember events well, it is unsurprising that they provide less accurate answers to specific questions and confabulate. In addition, lawyers often use complex vocabulary, complex syntax, negatives and double negatives, and multiple questions. These questions are problematic because the witness may not comprehend what is being asked, and their confusion about what the question means can make them look as if they are confused about what they remember rather than the question itself. Furthermore, the fact that many witnesses are suggestible means they may simply give "yes" answers and it may not be clear what they understand the question to be. People with social and cognitive difficulties are more likely to be suggestible because of their poorer memory capacity and impairments in coping with the uncertainty, expectations, and associated pressures.

The implication of this is that the quality of evidence that witnesses provide can be improved by using questions that the witness can understand. Some forms of questioning are permitted in law, and so the judge must allow them; nevertheless, the judge can ensure that some forms of questioning that are problematic for witnesses are modified. For example, the judge may require that multiple questions are split into individual questions and that complex vocabulary is made understandable. This can be achieved without violating the defendant's rights but often requires that the judge is informed of what questions are likely to be particularly problematic for the witness. This information can be provided formally by a witness assistance program. In addition, interpreters have been used to facilitate the giving of evidence for those who are not fluent in the language of the court. This has not been particularly problematic as long as the interpreter's translations are accurate and verifiable. However,

more controversial is the use of intermediaries with people who have a form of idiosyncratic communication, for instance, some individuals with an intellectual disability that may be able to communicate in a way that is not understood by others, which does not necessarily seem objective.

Finally, after the court case has finished, witness assistance programs may still have a role to play. This role may involve explaining the verdict and ongoing support. In some cases, witnesses may be distressed by the verdict and may feel that the jury did not believe them; in these cases, the high standard of "beyond reasonable doubt" may need particular explanation.

WOMEN'S SHELTERS/HELP LINES

Shelters and help lines are on the front lines of service provision for intimate partner violence victims. This entry explores the definitions of shelters and help lines; provides some historical background; discusses current perspectives and methodologies; discusses what help is available on a national, state, and local level; and ends with a look at how many services were provided by domestic violence programs on one particular day in September 2007.

Definitions

Domestic violence shelters are designed specifically to protect women who are at risk of danger from their intimate partner. Emergency shelters were created to be short-term living spaces in response to an immediate crisis for victims and their children. Women in need of such safe haven often arrive at a shelter without many personal belongings, money, or other resources because of the peril involved in leaving their abusive partners. Consequently, domestic violence shelters provide a variety of services to both women and children to help families rebuild their lives.

Domestic violence help lines—also referred to as hot lines or crisis lines—are services on the telephone, 24 hours a day, 7 days a week. Calls are toll free, confidential, and can be anonymous. Help lines usually provide services to non-English-speaking callers through language interpretive services and have TTY capabilities for those who are deaf or hard of hearing. Those frequently calling for help are victims themselves, but also they can include family, friends, and even perpetrators. Consultation also occurs with professionals working with victims, including law enforcement, health care professionals, mental health/social service providers, educators, clergy members, and attorneys.

Historical Perspective

Providing shelter to women and children who experience domestic violence began as a movement in the United States in the early 1970s. Guided by feminist values, the shelter movement believed in the empowerment of women and worked toward ending all forms of abuse, oppression, and discrimination. Early shelters and help lines were grassroots organizations, run by volunteers and a few paid staff. Some communities began with safe homes, where dedicated individuals shared their homes with women and their children. By the late 1970s and early 1980s, many communities were marshalling resources to create group housing to shelter victims.

In the early days, the battered women's knowledge base was just developing. Books such as Del Martin's *Battered Wives*, published in 1976, provided initial guidance about how to provide assistance. Shelters were opened with no specific

operational guidelines or regulations, aside from group home standards and health department regulations. Those managing programs had to develop their own training programs. Communities were suspicious that “those women” working at shelters/help lines “were breaking up the family.” Conversely, domestic violence programs were distrustful of potential allies, especially law enforcement and others in the legal system, as victims’ experiences were often not believed. Legislation about domestic violence was nonexistent, and financial resources were also a struggle. Most programs were initially supported locally through partnerships with United Way chapters, mental health boards, foundations, and individual donors.

Current Perspective

Today there are many more resources for, and a wealth of information available about, intimate partner violence that enhances the ability of shelters and help lines to provide quality services, focusing on collaboration and inclusiveness. Legislation recognizes domestic violence as a crime, and laws have been instituted to protect victims. Even the use of language has changed. Instead of referring to domestic violence as wife battering, the term *intimate partner violence* is used more frequently because it captures the variety of ways in which intimate partners of either gender experience domestic violence in gay, lesbian, and straight relationships.

In the 1980s and 1990s, national legislation improved the base of financial support for domestic violence programs. Congress enacted the Victims of Crime Act, the Family Violence Prevention and Services Act, and the Violence Against Women Act (VAWA). Many states legislated fees on marriage licenses as a method to fund shelter programs. This income has greatly stabilized services; yet programs are still not funded at adequate levels, and a variety of resources are needed to balance program budgets on a yearly basis.

Current Methodology

Shelters and help lines have documented fact-based methods to save women’s lives. Among the major contributors are Barbara Hart’s innovative work

with the legal system and developing coordinating councils, Jacqueline Campbell’s pioneering lethality risk instrument, Ginny NicCarthy’s practical advice for ending abuse, and Susan Schechter and Ann Jones’s strategies for women with controlling partners. Also, there are standards on what type of services should be provided.

Those providing assistance are expected to be culturally competent with a diverse client base, encompassing race, culture, ethnic background, disability, religion, gender, immigrant status, and sexual orientation. Community-wide collaborations are now the norm, often in the form of domestic violence coordinating councils to enhance the effectiveness of services for victims and batterers. Recognition of the barriers victims experience when living in rural communities has brought attention to the lack of resources and has served to reallocate some resources to these communities. More shelters and help line programs recognize the need to train staff about children who witness domestic violence, the issues male survivors experience, and how to help teens experiencing dating violence. Teen dating violence prevention programs are offered in many communities. Engaging men, both teens and adults, in the field of prevention is now recognized as an integral aspect of eliminating violence against women.

Services Available

Several national organizations provide and/or coordinate services to victims, provide technical support to professionals in the field, work on public policy, and increase public awareness about domestic violence. These organizations include the Family Violence Prevention Fund, the National Coalition Against Domestic Violence (NCADV), and the National Network to End Domestic Violence (NNEDV). In 1996, the National Domestic Violence Hotline (NDVH) was created with VAWA support to provide services in all 50 states, Puerto Rico, and the U.S. Virgin Islands.

State coalitions against domestic violence, such as the Minnesota Coalition for Battered Women and the Pennsylvania Coalition Against Domestic Violence, are membership organizations made up of shelters, help lines, other domestic violence programs, supportive agencies, and concerned individuals. State coalitions provide technical assistance, resources,

information, and training to all who address or are affected by domestic violence, and they promote social and systems change through public policy, public awareness, and education initiatives. Most coalitions also link victims to local resources.

Number of Programs

According to the 2008 *National Directory of Domestic Violence Programs*, published by the NCADV, there are approximately 2,000 domestic violence shelters and programs in the United States. However, the coalition reports that not all domestic violence programs list their programs with the NCADV. Shelters and help lines can be stand-alone nonprofit organizations or programs within a larger nonprofit agency. Some programs only serve domestic violence victims, and some are dual programs also serving sexual assault victims.

Shelter Operations

Shelter facilities can be a variety of physical structures. A shelter may be a renovated home, a residential floor in a YWCA, a specially built facility, or even paid hotel rooms. Shelters try to provide the same amenities that one's own home would have, including meals, clothing, and private bedrooms with enough beds for each family member. Victims are usually asked to not disclose where they are staying to keep those who live and work at the shelter safe. Shelter stays are anywhere from 30 to 90 days, with extensions based on extenuating circumstances. Some communities also provide transitional housing after the initial emergency shelter, which provide additional housing and supportive services. Most shelters are staffed around the clock to be able to respond to the emergency needs of victims.

Help Line Operations

Help lines are designed so that callers can seek assistance as often as needed, 24 hours a day, 365 days of the year. During a typical call, trained staff will provide crisis intervention, education/information, and safety planning, which is a process of strategizing with the caller on how to reduce the risk from the batterer. An example of safety planning is teaching a child how to run to the neighbors and call 9-1-1 when the batterer becomes abusive. If

the help line is part of a shelter and the caller needs emergency housing, intake procedures occur to determine whether the shelter is a viable option. If the help line is a separate organization, a referral is made to the shelter. With modern technology, the call is often transferred directly to the shelter so no second call is needed.

Overall Services

Services may vary slightly, dependent on the community. All services should be accessible to victims with disabilities and to non-English-speaking victims. Most shelters and help lines offer the following:

- *Crisis intervention and/or counseling*—includes empathetic listening, developing options, safety planning, information, and referral, as well as guidance. In states where licensure is required to counsel, crisis intervention is provided versus counseling.
- *Advocacy*—acting on a victim's behalf and with her permission, barriers are removed that impede progress with law enforcement, social services, landlords/housing, health care, etc., including assistance in securing rights, remedies, and services. For instance, a trained advocate might accompany a victim to a hospital emergency department to document injuries with photographs.
- *Court accompaniment/legal services*—accompaniment and advocacy throughout a criminal or civil court process, such as help with protection order paperwork or accompanying a victim during a court proceeding.
- *Children's services/child care*—providing counseling, child care, or children's activities.
- *Support groups/group counseling*—offering support, education, and guidance in a group setting. Again, licensure issues may apply.
- *Emergency financial assistance*—cash outlays for transportation, food, clothing, emergency housing, etc.
- *Case management*—overall coordination of a service plan for clients.

Training, Prevention, and Public Awareness

Training, prevention education, and public awareness are also activities that shelters and

help lines provide to the community. Professionals who work with victims are trained on how to identify domestic violence, provide sensitive intervention, and offer appropriate referrals. Speeches are made to community groups to increase awareness about domestic violence. Teen dating violence prevention education is provided to students. Public relations and marketing activities occur to ensure that victims, their family and friends, and the general community know how to access help.

How Many Victims Seek Help

In an effort to understand more fully the number of victims seeking help, in 2006, the NNEDV developed the National Census of Domestic Violence Services. This census collects an unduplicated count of adults and children seeking services from domestic violence programs in the United States during a single 24-hour period. In the second annual census, conducted on September 25, 2007, 69% (1,346 out of 1,949) of identified domestic violence programs participated. The census found that 53,203 victims were served in one day. Of these victims, 25,321 victims were housed in emergency shelters or transitional housing and 27,882 adults and children received non-shelter services, such as counseling, court accompaniment/legal advocacy, and/or children's services. Programs also answered 19,432 help line calls, with an extra 1,150 calls answered by the NDVH. Programs also reported conducting prevention training and community education to 29,902 individuals in their communities. Lastly, the participating programs reported 7,707 requests for services they were unable to meet. Deficits of resources and funding caused a lack of shelter space, reductions in staffing, and even cuts in programming. It is clear that although much progress has been made in serving intimate partner violence victims and their children, there is still much work to be done.

WOMEN'S USE OF AGGRESSION

Decades of research have focused on men's use of aggression, often defined as behavior intended to

harm another person physically or psychologically. Recently, attention to women's use of aggression and the different contexts in which it occurs has increased. Research has found that women initiate physical aggression more often in the home (e.g., within relationships) than in the general community (e.g., against strangers and acquaintances). This entry describes (1) women's aggression in community and relationship contexts, (2) the risk factors and correlates of women's aggression, and (3) responses to and interventions for women's aggression.

Contexts in Which Women Use Aggression

Community Context

Limited data show that women's aggression in the community, such as toward acquaintances and strangers, has a different pattern than their aggression in relationships, such as toward intimate partners or children. Women's aggression toward acquaintances tends to be unplanned, in response to the acquaintance-victim's behavior, and related to substance use. For example, a study of more than 200 female inmates of a New York prison found that women convicted of homicide were involved in the drug market and used aggression toward acquaintance-victims to protect their economic investment in the market. Data on women's aggression toward strangers also are limited, with most information deriving from studies of robbery. This limited information shows that women are more likely to use weapons (1) when perpetrating robberies compared with other violent crimes and (2) when robbing a male victim than a female victim.

Relational Context

Intimate Partners

More than 100 studies have found that women self-report using physical aggression in relationships as frequently as men. These findings have led to broad conclusions that "women are as aggressive as men," which have generated a great deal of controversy. Some researchers view these conclusions as oversimplifications because they focus solely on the frequency of physically aggressive acts without taking into account the context

in which aggression occurred, motivations for the use of aggression, and consequences of aggression to the victim. Studies that have addressed context of, motivations for, and consequences of women's aggression show that women often are aggressive in the context of their own victimization, often use aggression in self-defense, and experience more serious consequences as the result of their partners' aggression against them than vice versa.

Psychologist Michael Johnson identified the typologies of women's and men's use of aggression in intimate relationships that are focused on the extent to which the motive for the use of aggression is to control the partner. His four typologies are (1) *situational couple violence*, (2) *violent resistance*, (3) *intimate terrorism*, and (4) *mutual violent control*. Respectively, Johnson's typologies describe relationships in which (1) aggression is perpetrated by both partners toward each other as a function of specific conflict, *without* the aim of controlling another person's behavior; (2) aggression is used to protect oneself from enduring more aggression and control; (3) aggression is perpetrated to control the partner's behavior; and (4) aggression is perpetrated by both partners to control the other person's behavior. In heterosexual relationships, *situational couple violence* is the most common typology, whereas *mutual violent control* is the least common. Similar to heterosexual relationships, violence in some lesbian relationships has been found to reflect *intimate terrorism*, particularly when one woman is more dependent on the other.

Children

The need to focus on women's aggression against children separate from men's aggression against women has become evident. Women, more often than men, perpetrate physical and psychological aggression against children. Women use moderate-to-severe forms of aggression against their children, which result in injury and, in extreme cases, death. In regard to sexual aggression against children, men are the perpetrators in 96% of cases. However, gender differences exist for the child-victim and adult-offender relationship such that more women than men perpetrate sexual abuse against boys, the most common form of which is touching.

Risk Factors and Correlates of Women's Aggression

Several factors have been identified as precursors and correlates of women's aggression in community and relational contexts. Risk factors for women's aggression include their experience of childhood trauma, a history of juvenile arrests, conduct disorder behaviors in childhood and adolescence, and poverty. Correlates of women's aggression include their own victimization as well as psychiatric symptoms, including posttraumatic stress, depression, and anxiety.

Response and Intervention

Women's aggression in community and relational contexts has been met with different responses. Response to women's aggression in community settings (typically in the context of drug marketing and robberies) has been to incarcerate them or mandate them to complete community-based anger management programs. The response to women's use of aggression in relational contexts, specifically toward intimate partners, is linked to the Law Enforcement Protection legislation of the 1980s, which allowed officers responding to domestic violence calls to arrest and charge the perceived perpetrator without the victim having the burden of doing so. Enactment of this legislation has led to increased arrests and prosecution of women for domestic violence offenses and, thus, to an increase in mandates to complete batterer intervention programs. The response to women's aggression toward children is to mandate them to complete parenting programs and/or to remove children from the home.

Overall, limited research exists focusing on response to and interventions for women's aggression. As more research focuses on women's aggression, specialized interventions can be developed that take into consideration the context in which women's aggression occurred, motivations for the use of aggression, and consequences of aggression to the victim.

WORKPLACE, DOMESTIC VIOLENCE IN THE

Every year, an estimated 1.8 million women report severe physical assault by an intimate partner. The lifetime prevalence of intimate partner violence for women is 25% to 30%. This violence includes physical and sexual assault as well as psychological victimization, and the estimates likely underestimate the actual occurrence of partner violence. Most of these victims, and the perpetrators of this violence, are members of the workforce.

Violence against women, often perpetrated by male partners or ex-partners, has been linked with injuries, homicide, and other short-term and long-term sequelae, including complications of pregnancy and adverse pregnancy outcomes, sexually transmitted diseases, chronic pain syndrome, irritable bowel syndrome, posttraumatic stress disorder, and depression. Much less is known about the effects of partner violence in the workplace, but logic would indicate that with the number of victims and the severity of the consequences, the effects are likely to be broad.

Extent of Workplace Domestic Violence

Although there is no precise estimate of how much domestic violence (DV) occurs at work, it clearly represents a daunting challenge, affecting a sizable proportion of the approximately 140 million employees in United States. Several national-level data sources shed some light on the extent of workplace DV.

The Census of Fatal Occupational Injuries conducted annually by the Bureau of Labor Statistics shows that homicide is the leading cause of death for women on the job. During 1992 to 1994, 17% of the alleged perpetrators who killed women at work were current or former partners.

According to a Federal Bureau of Investigation report, each year approximately 3% of workplace homicides are known to be perpetrated by an intimate partner. Of the workplace homicides committed by an intimate, approximately 62% were committed by a husband ($n = 122$) and 37% were committed by a boyfriend ($n = 72$). Far fewer homicides, nearly 2% ($n = 3$), were committed by a wife.

The annual National Crime Victimization Survey reports more than 1.7 million workplace violent victimizations (i.e., rape, sexual assault, robbery, and simple and aggravated assault) each year, with many of these perpetrated by partners. A larger percent of female employees were victimized by an intimate rather than by their male counterparts. Five percent of the women victimized at work were attacked by a current or former spouse or boyfriend compared with 1% of the men.

These estimates, however, drastically underestimate the extent of DV in the workplace. Although existing data systems can be used to identify work-related deaths, work injuries, and violent victimizations, no existing data source was specifically designed to identify the nexus between DV and the workplace. This inability to measure workplace DV is, in part, because few sources measure both the relationship of the violent act to work and the relationship between the victim and the perpetrator. Furthermore, data sources are not available to capture events such as psychological abuse or stalking. Thus, the answers to many important questions about the frequency, types, and consequences of DV in the workplace are largely unknown.

Effects of Domestic Violence on Employees

Studies of DV in the workplace have begun to establish the damaging effects of the violence on every component of a work organization. DV in the workplace affects the safety and health, as well as the productivity, of the victim employee, the perpetrator employee, their co-workers, and the organization as a whole. It is estimated that almost

\$900 million in lifetime earnings alone is lost because of the premature death of female victims.

Effects of Domestic Violence on the Abused Employee While at Work

The effects of DV on the victim's work opportunities and performance are broad. Victims of violence may have difficulty seeking work because of the control their partners demonstrate, such as extreme isolation or blocking access to transportation. In addition, many victims are underemployed, with women who have experienced DV in their lifetime reportedly earning, on average, \$12,000 less per year than their nonvictimized counterparts.

Physical and emotional harm endured by DV victims causes increased absenteeism, including tardiness and missed work days. A study of female DV victims, ages 18 to 65, found that one in four were late to work or missed days of work because of their partner's abuse. Common interference behaviors used by the perpetrator include neglecting to provide transportation or child care to the victim and physical violence that causes severe injuries resulting in the victim being unable to go to work. In addition, 75% of employed DV victims are bothered by the perpetrator while at work. Perpetrator tactics involve harassing phone calls to the victim's place of employment and showing up unexpectedly. The fears of abuse looming over the victim while in the workplace result in distraction. This distraction may be a leading source of victim lost work productivity.

Financial costs endured by the victim are staggering. More than 30,000 full-time jobs, the equivalent of 8.0 million days of paid work, are lost each year because of DV as well as approximately 5.6 million days of household productivity. It is estimated that these lost days cost victims and their employers at least \$192 million annually.

Absenteeism and poor performance resulting from violence has resulted in abused women losing their jobs and earning lower wages. Jody Raphael determined that almost one third of abused working women lost or quit their jobs because of their DV situation. Victims often must quit their job in the process of ending the abusive relationship so that they can relocate away from the abusive partner and try to find safe environments while ending the relationship.

Although DV victims suffer negative consequences at their workplaces, they are just as likely to be employed as nonvictims. Some research has found that DV actually boosts labor market participation. Although this may seem conflicting to the findings previously discussed, DV victims may seek employment for increased protection. Employment may allow an abused woman to continue or reclaim her financial independence as well as provide much needed social support from supervisors and co-workers, although one in three report not telling an employer about the abuse. In addition, an abused woman's workplace may provide a safe haven from the abuse she receives at home.

The Impact of the Perpetrator-Employee on the Job

Little is known about the number of violent or abusive acts a perpetrator may commit using job-related resources. Interviews of batterer's in six Maine intervention programs found that almost 9 in 10 DV offenders used company resources to reach their partner while on the job, with the majority reporting use of the company phone and car. Perpetrators reported using work resources to check up, bully, intimidate, or express remorse/anger to the victimized partner. The majority reported using the company's car to drive to the victim's home or workplace during working hours, which could pose a threat to the victim's co-workers.

The DV abuser's ability to function on the job is also impaired. Abusers self-report that mistreating their partner has a negative effect on their job performance. Almost half of abusers (48%) admitted that thinking about their relationship, while on the job, caused them to be distracted. A smaller proportion (19%) reported a mistake or near-miss disaster brought about by their abusive actions toward a loved one. Being retained in police custody because of their perpetration of abuse work resulted in more than 15,000 hours of work time lost.

Absenteeism is not only a problem for victims but also for the perpetrators of the violence. Almost half of abusers reported they had been late to work or left early because they were committing acts of abuse against their partner.

A focus group of male DV abusers, administered by the Massachusetts-based Employers against Domestic Violence, reinforced the lack of consequences for DV

perpetration while in the workplace. Supervisors of offenders showed compassion toward them, rarely enforcing consequences for work missed because of court dates or imprisonment. Substance abuse difficulties were often addressed by supervisors, but rarely did they acknowledge troubles related to DV with the abusers.

Consequences for Co-Workers

The significance of workplace victimization to co-workers of the victim and perpetrator is largely unknown. A third of DV victims have disclosed the abuse to a co-worker, and 44% of respondents to a national survey reported that their workplace was impacted because of domestic abuse to a co-worker. Little research has investigated the consequences of working with a DV victim or perpetrator on co-workers, but the potential for decreased work productivity, affects on the work environment, witnessing of harassment, stalking, and even physical assault are high. Nearly 65% of respondents also reported that they were aware of an intimate partner harassing a co-worker while at work. Co-workers are also at risk in the most extreme acts of violence, such as the potential for involvement when a perpetrator attempts to murder a victim while at work.

However, interactions with co-workers can be critical for victims. Victims of DV have reported that support given by co-workers and others at work has helped them keep their job, and 80% have said it helped them cope with the violence. With the high proportion of DV victims engaged in the workforce, the positive interactions with co-workers indicate that the workplace can play a critical role in interventions.

Costs to Businesses

Business executives and managers are increasingly knowledgeable about the effects of DV on their corporate operations. In 2002, more than 50% of employers were aware of employees who had experienced DV, a 16% increase since 1994. Whether this represents increasing workplace DV or increased awareness is unknown, but these findings are likely a combination of both. Although employers are more aware, only 5% of companies have policies specific to DV.

A study supported by Liz Claiborne reported that almost all (91%) senior executives and managers of Fortune 1000 companies believed that DV affects both the private and working lives of their employees. More than half (60%) reported concerns that DV impacted their employees' psychological well-being, physical safety (52%), productivity (48%), and attendance (42%). A series of focus groups with 25 health benefit managers throughout the country have corroborated these findings. The managers stated that DV victims have increased absenteeism, an inability to focus, poor self-esteem, low productivity, and low morale.

The direct financial costs, including medical expenses and lost productivity, of DV on businesses is astounding. Half of the respondents to a Liz Claiborne survey recognized that DV had a negative effect on their company's insurance and medical costs. A single DV victim can incur greater than \$2,000 more per year in medical expenses than a nonvictim with a staggering total of almost \$24 million per year in medical costs to businesses. In addition to medical costs, an estimated \$100 million is spent on lost wages, paid sick leave, and absenteeism to DV victims. Executives and managers recognize how these additional costs affect their company's bottom line and that DV deserves more of their attention.

Legal liability has a price tag, too. Employers can face a range of liabilities for failing to address DV threats, including failure to secure the workplace from known threats and indirect liability for not intervening on known dangers. Although these liabilities have not been tried extensively in courts, findings increasingly favor victims. Employers can also be liable under torts for negligent hiring, retention, supervision, and termination should an employer fail to screen or remove dangerous employees or situations.

Legal Rights and Employment Protections for Domestic Violence Victims

As the scope and toll of DV are better understood, legal protections for victims are increasing, and many of these include work protections. Many new policies that protect DV victims against employment discrimination are being implemented, such as policies in many states that prohibit any employment discrimination against DV victims.

Many states are also implementing policies that prohibit employers from penalizing employees for taking time off to seek protection orders, seek medical care, or other activities related to being a victim of DV.

Other policies require employers to protect workers from the potential effects of DV. The OSHA General Duty clause states that employers have an obligation to maintain a safe workplace. Some states have identified violence as a general hazard, and some have identified DV in the workplace as an aspect of the violence hazard.

How Domestic Violence Is Being Addressed in the Workplace

Especially in large workplaces, many different departments are important in the identification of and response to domestic violence. Workplace leadership needs to recognize the problem and to implement policies and procedures that support the identification and active response for both victims and perpetrators. Supervisors need to be trained in the existing policies and procedures, as well as taught appropriate skills to engage in a successful response. Human resource personnel are critical in developing and implementing protocols and procedures once domestic violence has been identified. Risk management and security need to protect the physical environment from domestic violence hazards, such as maintaining secure buildings and circulating information about potential perpetrators who should not have access to the workplace. Occupational medicine and other health care providers to the workforce can be helpful by screening for abuse. It is much more difficult in smaller businesses to identify appropriate resources and responsibilities to respond to domestic violence. However, general workplace acknowledgment and communication about the potential influence of domestic violence is critical for all types of workplaces.

There has been little systematic research to identify how many employers are addressing the issue of DV in their workplaces, what these employers are doing, and how successful they have been. Bonnie Fisher and Corinne Peek-Asa conducted a content analysis of publicly available documents and found that few programs provided comprehensive strategies for addressing the problem, and no program

had been adequately evaluated. Three resources were found to be particularly helpful for employers:

- Information about “best practices” addressing workplace partner violence is available through the Corporate Alliance to End Partner Violence (CAEPV), a national nonprofit organization whose mission is “reducing the costs and consequences of partner violence at work—and eliminating it altogether” through a variety of means, including education, policies and programs, legal issues, and legislation.
- A Sample Policy of Domestic Violence, developed by the National Center on Domestic and Sexual Violence, which provides information for developing a comprehensive DV workplace policy.
- A resource guide for employers, unions, and advocates, developed by the Family Violence Prevention Fund.

A range of topics are included in these guides, including guidelines for supervising victims of DV, pointers on how to talk with an employee who is a perpetrator of abuse, designing personal and workplace safety plans, securing the work area, as well as identifying and treating DV, legal issues, and union responses to DV.

Despite these and numerous other guidelines, employers have few resources for proven programs to address DV in their workplaces. They have even fewer resources about how these programs can be implemented in various work settings. A growing interest in this topic, which will be fueled by growing awareness and recognition of its toll and consequences, will hopefully lead to more informative state-of-the-art models.

The Future

The workplace provides an ideal setting for efforts to prevent DV and support its victims. Workplaces are relatively controlled environments in which protection strategies can be tested and implemented. Employers should be motivated to test these programs because they will likely positively impact worker morale and productivity, and they could prevent potential events for which they could be held liable. As this field of work moves forward, it is hoped that employers become increasingly

proactive in assisting victims and in creating an intolerant atmosphere for DV perpetrators.

WORKPLACE BULLYING AND PSYCHOLOGICAL AGGRESSION

Research on workplace bullying and psychological aggression has grown considerably during the past decade, and it now cuts across several academic disciplines. Joel Neuman and Robert Baron note that workplace aggression is a comprehensive term that refers to any acts that are intended to harm workers in settings or situations related to their work, which can be physical or nonphysical in nature. In the literature, workplace aggression is considered an umbrella term for a variety of more specific types of behavior, including bullying, mobbing, incivility, emotional abuse, petty tyranny, abusive supervision, and generalized or status-blind harassment. Psychological aggression at work typically refers only to those acts or behaviors that are nonphysical in form and are intended to cause psychological distress or harm to the target. Workplace bullying, on the other hand, incorporates both physical and psychological forms of aggression and has been defined more specifically with regard to persistence, frequency, and duration of negative work behaviors directed at one or more individuals in the workplace. A pattern of behaviors is considered bullying only if it is persistent, occurring repeatedly during a given period of time rather than as isolated incidents that happen only occasionally.

Types of Behaviors

Generally speaking, workplace bullying and psychological aggression involve a wide range of behaviors that threaten, intimidate, humiliate, or

undermine an individual's work reputation or performance. The types of behaviors include harassing, offending, social exclusion, derogatory remarks, insults, sabotage, withholding information, noninclusion, and physical acts that are perceived as intimidating or threatening. Acts of workplace psychological aggression and bullying most commonly involve nonphysical forms of aggression (either verbal or nonverbal) and are more likely to be passive in nature rather than active. These behaviors may be directed at one or more individuals in the workplace by one or more co-workers, supervisors, or customers/clients/patients.

Prevalence

Estimates of the prevalence of workplace bullying and psychological aggression vary depending on the sample used, how the terms are defined, how the time frame is used, and how the researcher asks the questions about the experiences and behaviors. Studies indicate that roughly 10% to 14% of workers report being victims of bullying, and this figure increases to 40% to 50% if those who are witnesses to bullying are included. Estimates of psychological aggression range from 27% and upward of 59% and even higher, depending on the study. Both men and women in the workplace may be targets of psychological aggression and bullying, as well as aggressors, and bullying and psychological aggression may be experienced at all levels of the organization, including management. Workplace bullying and psychological aggression tend to be more prevalent in the health care and service delivery sectors.

Risk Factors

Several workplace factors have been shown to be related to workplace bullying and psychological aggression. Job characteristics such as increased workload and lack of job control and organizational features, including structure, politics, role ambiguity, and role conflict, have all been associated with workplace bullying and psychological aggression, as well as issues surrounding organizational change such as job insecurity and social change. Leadership style, interpersonal conflicts, poor organizational climate and culture, low levels

of organizational justice, and lack of social support from co-workers and supervisors also correlate with workplace bullying and psychological aggression. Lastly, some research indicates that individual or personality characteristics of the actors may also be related to engaging in aggressive behaviors in the workplace.

Consequences

Workplace bullying and psychological aggression have been found to be harmful to both the individual and the organization. Experiencing these negative behaviors has been related to decreased psychological well-being, including symptoms of depression, anxiety, feelings of helplessness, post-traumatic stress disorder, alcohol and substance abuse, and anger as well as to decreased cognitive functioning (attention, concentration). Psychosomatic complaints such as headaches, sleep disturbances, and gastrointestinal disorders have also been reported. Bullying and aggression also cost the organization in terms of poor job performance, reduced productivity, lowered job satisfaction, reduced organizational commitment, withdrawal from social and professional activities, and increased absenteeism and turnover. Experiencing these adverse behaviors at work may also spill over into family and home life. Furthermore, workplace bullying negatively impacts not only those targeted for the behaviors but bystanders or witnesses on the job as well.

Prevention and Intervention

Several suggestions have been made for preventing workplace bullying and psychological aggression, although few studies of intervention effectiveness have been conducted. It has been recommended that on an organizational level, goals, roles and responsibilities, policies, guidelines for acceptable behavior, and ethics should be clearly stated and infused throughout the organization. Successfully preventing workplace bullying also involves creating an organizational climate that fosters openness, respect, and tolerance of diversity. Some researchers have suggested that emphasis should also be put on management and supervisory styles or practices that promote fair treatment and respect for all employees.

Training has also been advocated for preventing workplace bullying and psychological aggression. It has been put forth that employees and managers should receive training in basic communication skills, conflict management, and de-escalation techniques, as well as specific training in workplace aggression.

In terms of intervening, both formal and informal systems have been proposed for dealing with incidents of workplace bullying and psychological aggression. These systems might include involvement of personnel or human resource professionals, use of employee assistance programs, formal complaint or grievance procedures, or using informal response teams and coaches.

It is important to keep in mind that few systematic evaluation studies are available regarding the effectiveness of interventions for workplace bullying and aggression. The need for such research continues to be a significant gap in the literature.

WORKPLACE VIOLENCE, INTERNATIONAL PERSPECTIVE

The main concern of environmental criminology is to focus on crime patterns. Recurring events have certain patterns that give clues to develop preventive measures. Crime prevention efforts usually have been directed to street crimes to prevent subsequent victimizations. However, recent research indicates that workplace violence is a major problem that needs to be considered along with traditional crimes. Today, workplace violence has been accepted as an emerging problem in many countries. In the United States, for instance, almost 1,000 workers are murdered at work each year. When considering the 2005 homicide rate (5.6/100,000) of the United States, nearly 1 out of 16.6 homicides is because of workplace violence. That makes workplace homicide the second leading cause of death in the United States.

Even though workplace violence is so prevalent in the world, it is difficult to predict its magnitude for several reasons. They are as follows:

- Most studies in the literature are just a decade old; therefore, limited research is available to predict the prevalence of workplace violence.
- The interest of international organization for workplace violence is new. As an example, the International Labor Office (ILO) published its first report regarding workplace violence in 1998.
- Most countries do not have organizations that specifically focus on workplace violence.
- The form of workplace violence can range from basic psychological pressure to murder. Although it is possible to record serious incidents (i.e., injuries and murders), other forms of workplace violence (i.e., bullying and psychological threats) usually remain unreported. For instance, it was found that official records of workplace violence in Turkey are 1,300 times less than the ILO's predictions.

Definition and Types of Workplace Violence

The U.S. Department of Transportation defines workplace violence as "assaults, other violent acts or threats which occur in or are related to the workplace and entail a substantial risk of physical

or emotional harm to individuals, or damage to government resources or capabilities."

In general, three types of workplace violence are based on the assailant-victim relationship.

- (1) *Outsiders*: The perpetrator has no legitimate business relationship with the targeted workplace and workers. A typical example for this category is robbery (unknown perpetrator vs. worker).
- (2) *Customers*: The perpetrator is a customer or client that receives service from the service provider. A nurse victimized by a patient well illustrates this type of workplace violence.
- (3) *Employee*: The perpetrator is a current or former co-worker or manager. For instance, a manager can victimize his or her victim by using physical abuse or psychological threats.

The definition from the U.S. Department of Transportation includes all three types of workplace violence. In this respect, this definition seems highly inclusive.

Forms of Workplace Violence

The forms of workplace violence are broad. It can be physical, psychological, sexual harassment, or bullying/mobbing. Studies indicate that women disproportionately experience workplace violence, especially for sexual harassment. One of the underlying reasons is that women generally work in high-risk occupations such as hospitals.

Regardless of the seriousness of the form of workplace violence, even the consequences of psychological threats on workers and third parties (i.e., close friends and family members) are tragic. Many workers experience mental health problems as a result of workplace violence.

International Perspective to Workplace Violence

The 1996 International Crime (Victim) Survey conducted by the United Nations Inter-Regional Crime and Justice Research Institute is one of the rich sources of information regarding the prevalence of workplace violence in the world. It was conducted in 32 different countries. The survey measured

workplace violence by incident type (assault and sexual assault) and gender. The survey suggests that France, Argentina, Romania, Canada, and England reported the highest rates of workplace violence incidents among 32 countries. According to this survey, developed countries experience more workplace violence than countries in transition. One limitation can be thought of in terms that people in developed countries might be more likely to report their traumatic experiences at the workplace. For this reason, the survey may be misleading in terms of prevalence of workplace violence in the world.

Apart from this big picture, individual studies in some countries may also help see the magnitude of workplace violence. For instance, in Germany, a 1991 National Survey, conducted by the Federal Institute of Occupational Health and Safety, indicated that 93% of women experienced sexual harassment at work during some point in their lives. In the United States, a 1999 Pinkerton Survey indicates that security executives believe workplace violence is the most important security threat. As noted, each year, 1,000 workers lose their life as a result of workplace violence in the United States. In addition, statistics report that 18,000 workers are assaulted at the workplace each year.

In the United Kingdom, a survey found that more than 11,000 retail staff were exposed to physical violence and that more than 350,000 staff were either threatened or verbally abused. In Japan, a newly established bullying hotline by the Tokyo Managers' Union received 1,700 claims within two short time periods. Claims were generally related to sexual harassment, stress, and bullying. In Finland, a telephone survey conducted by the Finnish Institute of Occupational Health indicated that 4.1% of workers (nearly 80,000) were subjected to either workplace violence or threats. The study also indicated that certain occupational groups, such as social service and transportation and traffic workers, are among the high-risk groups (10.5% and 6.8%, respectively).

In Australia, a self-reported survey indicated that 50% of aged care sector nurses experience workplace violence. In Hong Kong, a study that specifically measured workplace violence against nurses revealed that 73% had been subjected to verbal abuse, 45% to bullying, 18% to physical

abuse, and 12% to sexual harassment. Similarly, in South Taiwan, 62% of nurses experienced some form of workplace violence.

In Turkey, a study conducted by Forensic Medical found that most of the nonfatal injuries occurred in the workplace. In South Africa, workplace hostilities are unusually high. Some surveys showed that four out of five workers experience workplace violence during their work life. In the European Union, the Third European Survey on Working Conditions indicated that 2% of workers (3 million) had been the victims of sexual harassment and that 9% of workers (13 million) had been the victims of intimidation and bullying.

In general, studies suggest that people in certain occupations, such as taxi drivers, teachers, social workers, and health care workers, have a higher risk of workplace victimization. According to the 1998 ILO report, health care, social services groups, retail trade, banking, and transport are the occupations where workplace violence generally concentrate. It can be said that occupations that inherently require much public interaction (i.e., exchange of money, delivery services, or goods) experience a higher risk of victimization.

Workplace Violence Prevention

The above statistics indicate that the prevalence of international workplace violence is high in many countries. Workplace violence can be perceived as a leading cause of violence in some situations (i.e., homicide). In addition, today, workplace violence is one of the major health and safety issues in most countries. It causes critical health issues for workers that increase medical costs. Loss of work days and litigation costs can be considered in this context as well.

Given the prevalence of workplace violence in the world, it can be said that offices, schools, courts, and hospitals are no longer safe places as previously assumed. Workplace violent events increase day by day in most countries. In this context, workplace violence takes its place in crime prevention as an important emerging issue in the world. However, research on workplace violence is still young. In addition, current studies in the literature rarely separate types of workplace violence when they report their findings. This in turn may hinder the development of crime

prevention policy because one can hardly know whether prevention should be directed toward customers, outsiders, or co-workers. Putting it differently, a policy implication for taxi drivers who are repetitively victimized by outsiders should be different than for workers who are victimized by their co-workers.

Nonetheless, workplace violence is nonrandom and concentrates in certain occupations. Preventive strategies can be developed by identifying patterns of workplace violence. Concentrating only on health care and social services groups may address 50% of the workplace violence in most countries.

WORKPLACE VIOLENCE, PREVENTION AND SECURITY

According to data from the Bureau of Justice Statistics, between 1992 and 1996, more than 2 million incidents of workplace violence were reported per year. This includes 1.5 million simple assaults, 396,000 aggravated assaults, 51,000 rapes and sexual assaults, 84,000 robberies, and 1,000 homicides. Because of the extent of workplace violence, efforts have been made to try to reduce violence in the workplace. This entry outlines some measures that have been recommended and implemented in an effort to reduce workplace violence. It begins with a review of the risk factors for workplace violence.

Risk Factors

Research has identified several risk factors for workplace violence. These factors include exchange of money; guarding valuable property; delivery of passengers, goods, or services; contact with the public; working alone or in small numbers; working late at night or during early morning hours; and working in high-crime areas. Research has also identified risky occupations for fatal and nonfatal workplace violence. Risky occupations for fatal workplace violence include taxicab drivers, sales clerks, and work in security, liquor stores, gas stations/convenience stores, and bars. Risky occupations for nonfatal workplace violence incidents include retail sales, law enforcement, private security, health care, transportation, and teaching. Because research has identified specific factors and occupations that have been linked to higher risks of workplace violence, many prevention efforts have focused on these specific factors and occupations.

Environmental Approaches

One approach to trying to prevent violence in the workplace is through environmental modifications. Examples of environmental approaches for workplace violence prevention include the installation of metal detectors, bulletproof shields between workers and customers, and alarm systems; the modification of structures to reduce the ease of access by unauthorized individuals (e.g., fired

workers and violent partners); the reduction of isolation in work spaces; and ensuring that workers have an escape route in the event that an incident of workplace violence does occur. In addition, the Occupational Safety and Health Administration recommends that retail establishments improve visibility, maintain adequate lighting, install video surveillance equipment and closed-circuit television, put height markers on exit doors, use door detectors to notify employees when individuals enter the store, and control access to the store with door buzzers. Other examples of environmental approaches include using locked drop safes, limiting amounts of cash, and posting signs that limited cash is available.

Some evidence suggests that environmental approaches may lead to reductions in workplace violence. For instance, Ronald D. Hunter and C. Ray Jeffrey reviewed several studies on the effectiveness of environmental factors in reducing the potential for robbery in convenience stores. They found numerous types of environmental approaches associated with reductions in robberies at convenience stores, including good cash handling (e.g., limiting the amount of cash available and posting signs indicating limited cash), enhanced exterior visibility, and the use of security devices (e.g., robbery alarms, camera or video systems, controlled access safes, and mirrors).

Behavioral Approaches

Behavioral approaches to reducing workplace violence focus on training. For instance, employees can be trained to identify potentially violent customers or clients, to be cognizant of the warning signs of co-worker violence, and to use self-protective measures in the event that they do encounter a violent customer or client. Efforts to prevent workplace violence may also include training employees in listening and conflict-resolution skills.

Another behavioral approach to reducing workplace violence focuses on employee screening and effective hiring practices. Researchers recommend the use of thorough background checks on potential employees (e.g., reviewing applicants' criminal records, credit reports, driving records, military discharges, and education and employment backgrounds). In addition, it is recommended that employers verify applicants' references. Reference

verification may reveal important information such as the reasons that applicants left previous jobs. Finally, the interview process can be used to clarify discrepancies in the applicant's background and to see how the applicant deals with conflict, frustration, anger, and disappointment.

Administrative and Work Practice Controls

Another way to try to reduce workplace violence is through the use of administrative and work practice controls. Examples of administrative controls include prohibiting working alone and increasing staffing during late night or early morning hours (or even closing entirely during those hours).

As with environmental approaches, some evidence suggests that administrative and work practice controls may be effective in preventing workplace violence. For instance, Hunter and Jeffrey, in their review of studies on convenience stores, found that having two or more clerks on duty, especially at night, reduced the potential for robbery. In addition, their review of prior research indicated that closing stores from 10 p.m. to 6 a.m. reduced the potential for robbery.

Legislative Efforts

Some legislative efforts also have been designed to prevent workplace violence. These legislative efforts have occurred at the local, state, and federal levels. For instance, at the local level, some U.S. cities have passed ordinances that require bullet-resistant barriers between taxicab drivers and their customers. John Stone and Daniel Stevens examined whether these shields reduced assaults on taxi drivers in Baltimore, Maryland. They found a significant reduction in assaults against taxi drivers after the ordinance took effect. Thus, some evidence suggests that legislative efforts may be helpful in preventing incidents of workplace violence.

Future Research

Several security and prevention practices have been recommended and implemented in workplaces across the United States. Research suggests that some of these measures may be effective in reducing workplace violence. Future research

should continue to examine the effectiveness of these measures in an effort to decrease incidents of workplace violence across the United States.

WORKPLACE VIOLENCE, TRAINING AND EDUCATION

Workplace violence is any physical assault, threatening behavior, or verbal abuse occurring in the work setting or to an employee while on duty at another location. Threatening behavior can be defined as whatever makes someone feel threatened. It includes a statement or expression of intention to hurt, destroy, or punish.

Most workplace violence is not random and does not result in severe physical harm to the victim. Workplace violence originates from interpersonal conflict perpetrated by customers, patients, or clients of a business. It can also be conflict between co-workers or between a worker and his or her spouse manifesting as threats, attacks, stalking, intimidation, bullying, and harassment, including that of a sexual nature. Workplace violence results in injury to the targeted employee as well as in decreased morale of the entire workforce. Without proper intervention, these threats can escalate into more severe behavior causing serious injury or even death.

Duty to Act

Preventing violence in the workplace is the ethical and legal obligation of all employers. According to federal law, all employers are required to provide a work environment that is free of recognized hazards. If an instance of violence occurs, an employer can face civil liability if the employer failed to show due diligence when it hired or retained an employee who was dangerous or if it failed to provide proper physical safety measures, as well as adequate supervision and/or training.

Workplace Violence Training

Corporate Culture

The potential for workplace violence can be reduced if the leadership team of a business can create a culture of trust and mutual respect among workers of all levels. This is accomplished in part by drafting a strong written violence prevention policy that affirms the company's commitment to a safe workplace and clearly defines appropriate employee conduct. The policy should emphasize the employer's zero tolerance and willingness to take action on any employee's complaint.

Managers and supervisors play a critical role in preventing workplace violence because of their responsibility for the hiring, training, and the day-to-day supervision of all employees. Therefore, the training program should be deeply rooted at this level and should include lessons in effective management styles, pre-employment screening, training

of employees, and recognizing the warning signs of a problematic situation, as well as the evaluation and resolution of the same.

Effective Management

Managers must be trained to demonstrate a management style that is fair, empathetic, and consistently applied. Employees who believe they are treated fairly are less likely to be involved in instances of violence even during stressful periods such as disciplinary action, termination, workforce layoff, or business reorganization.

Screening Job Applicants

Preventing violence requires that managers perform proper background screening of job applicants to uncover any history of drug or alcohol abuse, past conflicts with co-workers, and convictions for violent crimes. Managers should be taught the significance of an applicant's hostile attitude, a history of frequent job changes, or a tendency to blame others for problems.

Recognizing Warning Signs

Unfortunately, despite all efforts to be diligent, problematic employees still slip through. Therefore, managers must be advised of the following warning signs of high-risk behavior:

1. Having an obsession with weapons or bringing a weapon to work
2. Making a direct or veiled threat
3. Intimidating or instilling fear in others
4. Displaying unwanted romantic interest in a co-worker
5. Paranoia
6. Unwillingness to accept criticism
7. Experiencing recent family, legal, or other personal problems

Domestic Violence

Domestic violence can spill over into the workplace. Therefore, managers must know the warning signs of domestic violence, including unexplained

absences, frequent use of leave time, anxiety, lack of concentration, and change in performance. Managers should be trained to encourage associates to report all troubling behavior or matters concerning their own lives or the private life of a co-worker without reprisal. These matters include disruptive phone calls, unexplained bruises or injuries, disruptive visits from family, and vandalism or threats.

Evaluating Threats

The manner in which managers assess and resolve threats and/or threatening behavior plays a critical role in the prevention of workplace violence. Managers should be trained to evaluate the credibility and viability of an expression of intent to do harm. Specific things to analyze include the nature of the threat and the context in which it was made. Care should be taken to analyze the subject's motivation as well as his or her ability to carry out that threat. Such analysis would include researching their work history, criminal record, military service, and past behavior on the job. Managers should know to seek advice and assistance from threat-assessment experts and law enforcement when in doubt.

Educating Employees

Managers can prevent violence by properly communicating the workplace violence policy to their subordinates along with the standards of conduct outlined therein. Managers can also educate employees on indicators of potential violence, how to report them, and how to respond to someone who seems troubled or potentially dangerous. Employees who work within individual retail establishments or remote offices or who travel and otherwise perform their duties away from the corporate office must be made aware of the risk factors associated with their jobs, and know how to mitigate those risks by strictly obeying the safety and security policies governing their workplace activities.

Prevention of Workplace Violence

Violence in the workplace can be reduced when a business creates an environment of mutual respect and trust among its employees. This environment

requires the adoption of a zero-tolerance policy and a well-communicated employee code of conduct. To prevent violence, a business must sustain high levels of awareness to potential threats at all times by providing thorough training for all levels of the workforce on a recurring basis.

WORKPLACE VIOLENCE, UNITED STATES

Workplace violence has always existed in the United States—indeed, during some periods of our history, fear, intimidation, and physical violence were commonplace in work settings. Contemporary expectations in industrialized democracies, however, are that all workers are entitled to a workplace free from recognized hazards. Until approximately the last 15 years, however, those hazards were defined almost exclusively as developing from exposure to chemical, thermal, or mechanical energy. Although some occupational groups recognized the risk of violence during the course of doing their jobs (law enforcement, corrections, and to a limited extent, health care—particularly psychiatric care), it has only been in recent decades that violence directed toward persons while at work or on duty has been recognized as an important occupational safety and health issue across all industrial sectors. The growing field of workplace violence has focused on both

understanding the risk factors for victims and developing recommendations to reduce the incidence and severity of events in the future.

Definitions

The term *workplace violence* encompasses a variety of events along a continuum of severity from words or actions that disrupt the workplace by making workers uncomfortable or fearful to physical assaults and homicides. In addition to variation by severity, it is clear that the term *workplace violence* means different things to different people. This is not a single issue, but it encompasses incidents across a range of circumstances and relationships between victims and offenders. For example, it is recognized that the violence that may occur during the course of a robbery of a taxicab driver or a convenience store is distinctly different from that which might occur when a distraught patient lashes out at a health care provider or when a co-worker or a boyfriend assaults someone in a workplace. In an effort to facilitate improved discussion of research and prevention needs and strategies, a typology of workplace violence has been developed that classifies the range of workplace violence incidents into four categories that are useful in thinking about research as well as potential prevention strategies. Specifically, the types are as follows:

- Criminal intent incidents in which the perpetrator has no legitimate relationship to the business and is usually committing a crime in conjunction with the violence (Type I).
- Customer/client incidents in which the perpetrator has a legitimate relationship with the business and becomes violent while being served by the business (Type II).
- Worker-on-worker incidents in which the perpetrator is an employee or past employee of the business and attacks or threatens another employee (Type III).
- Personal relationship incidents in which the perpetrator does not have a relationship with the workplace but has a personal relationship with the intended victim (Type IV).

This typology, taken along with the continuum of severity, allows the description of risk factors and prevention strategies across a matrix of events

of differing levels of physical or psychological harm and victim–offender–workplace relationships.

Recognition of the Problem

Although the earliest apparent discussion of workplace violence appeared in the *Journal of the American Medical Association* in an article titled “Assaults Upon Medical Men” in 1892, quantitative data on workplace homicide were first reported in studies of workplace fatalities in specific states, including a study in Maryland during 1978, Texas for the period from 1975 to 1984, and California for 1979 to 1981. Analysis of workers’ compensation data for the state of Ohio for the years 1983 to 1985 generated publications focused on the incidence of sexual assault of women at work and on the incidence of nonfatal workplace assaults in that state.

In the criminology literature from the mid-1970s through the 1980s, researchers were examining criminal victimization by occupation, victim injuries during robberies in an urban area, and the relationships between job activities and victimization risk. As well, workplace violence risks were being analyzed during this period within particular occupation and industry groups. Some authors have focused on particular risks faced by workers in small retail establishments with an emphasis on robbery deterrence, whereas others have examined the specific dangers faced by police officers. Still others have looked at the risks of violence in health care settings such as in hospital emergency departments and psychiatric inpatient units.

Despite this growing body of literature on specific geographic areas and particular occupations and industries, no national data had been compiled or published for workplace homicide. The first national data on the incidence of workplace homicide were published by the National Institute for Occupational Safety and Health (NIOSH) in 1989. These data demonstrated on a national basis that homicide was the third leading cause of occupational injury death—exceeded only by motor vehicle crashes and machine-related deaths—and identified that homicide was the leading cause of injury death for women in the workplace.

These data also indicated that although nearly half of workplace homicides occurred among workers aged 25 to 44 years, workers aged 65

years and older had the highest rates of workplace homicide by age group. Additionally, although the largest number of workplace homicides occurred among White workers, Black workers and workers of other races had the highest rates (or risk) of workplace homicide and retail trade, public administration (including law enforcement), and transport (including taxicab) industries had the highest rates of workplace homicide. These early data indicated, too, that homicide was the leading cause of occupational injury death in three of ten industry divisions, including retail trade, services, and finance/insurance/real estate. At that time, homicide was also the leading cause of occupational injury death in five states and the District of Columbia. Prior to this publication, homicide had not been seriously regarded as a significant occupational safety and health issue.

No discussion of workplace homicide would be complete without addressing the high-profile incidents and concerns about violence in the U.S. Postal Service in the 1990s. Indeed, the term *going postal* became synonymous with the image of an angry co-worker entering a workplace to kill current or former colleagues (Type III events). A careful scrutiny of data on occupational injury deaths in the Postal Service revealed that homicide was not the leading cause of occupational injury deaths in the U.S. Postal Service (that distinction was held by motor vehicle-related incidents) and the rate (or risk per 100,000 workers) of workplace homicide among Postal Service employees was essentially the same as the average workplace homicide rate for all U.S. industries combined. Moreover, only about half of the workplace homicides in the Postal Service were the high-profile incidents of disgruntled employees attacking co-workers and supervisors; the remainder included Postal Service employees murdered during robberies or other crimes while carrying out their duties.

In the early 1990s, data on the magnitude of nonfatal workplace violence also began to appear in the literature, with annual estimates ranging from 22,000 private-sector workers suffering assault-related injuries serious enough to require at least one day away from work to approximately one million workers reporting having been victims of crime while at work or on duty, representing 15% of the 6.5 million acts of violence experienced by Americans in the National Crime

Victimization Survey. During this same time period, other researchers began to focus on the psychological aggression and bullying aspects of workplace violence and to make links to organization of work issues such as work stress, hours of work, and the like.

Data Sources for Monitoring Workplace Violence

Data on workplace violence have been and can be gleaned from several sources, none of which has been specifically designed for the purpose of understanding workplace violence specifically and therefore are less than ideal. For homicides, the most comprehensive source of data is the Census of Fatal Occupational Injuries (CFOI), a data collection system maintained by the Bureau of Labor Statistics (BLS). CFOI is based on data taken from death certificates, supplemented with information from newspaper clippings and other varied sources. These data are available from 1992 onward and include not only homicides but the entire range of work-related fatalities such as motor vehicle and machine-related deaths as well as falls and other types of injuries. Variables available for analysis include demographic (e.g., age, race, and gender) and employment (e.g., occupation, industry, and self-employed) variables as well as details about the incident, including the type of event (e.g., shooting, stabbing, and other), the nature of the injury, and the location (e.g., convenience store, restaurant, and employer parking lot). BLS typically releases data for the previous calendar year in August. Data are available through Web-based tables and queries as well as through special requests to BLS staff.

For nonfatal workplace assaults, two national-level data systems have the capacity to describe victims and circumstances. The first is another BLS system, the Survey of Occupational Injuries and Illnesses. This annual survey of private-sector establishments, again, is not specific to workplace assaults but collects information on a full range of occupational injuries and illnesses. The portion of the survey that allows description of workplace assaults includes only those injuries serious enough to require at least one day away from work. Variables available for analysis include basic worker demographics, employer information, and

basic information about the circumstances of the event. Data are available through Web-based tables and queries as well as through special requests to BLS staff.

The second system is the National Crime Victimization Survey (NCVS). The NCVS is an ongoing household-based survey of persons 12 years and older conducted by the Bureau of the Census for the Bureau of Justice Statistics (BJS). The survey includes a question indicating whether a reported incident occurred while working or on duty. Variables available for analysis include occupation and industry, relationship of the victim to the offender, injuries sustained, and whether the incident was reported to the police. Periodic analyses of workplace victimizations have been completed and are available from the BJS Web site.

Impact and Trends

Workplace violence exacts a tremendous burden on workers, workplaces, and society at large. Using only data on the most extreme form of workplace violence—homicides—during the 11-year period from 1997 to 2007, BLS's CFOI system documented a total of 7,062 workplace homicides, which is an average of 642 homicides each year or nearly two workers murdered each day. Using a model that calculates direct and indirect costs of workplace fatalities, including medical expenses and lost earnings, researchers from NIOSH estimated the average mean cost of a workplace homicide incident (using data from 1992 to 2001) to be \$800,000. The total cost of workplace homicides during this time period totaled nearly \$6.5 billion. As staggering as these numbers are, they only capture one, albeit the most severe, form of workplace violence. The magnitude and cost of nonfatal workplace violence has yet to be fully measured.

On a more positive note, a 2007 trend analysis by Scott A. Hendricks, E. Lynn Jenkins, and Kristi R. Anderson pointed out that both the number and rate of workplace homicides in the United States declined during the decade from 1993 to 2002. The decline in workplace homicide rates was slightly greater than the decline in total U.S. homicide rates. Analysis of the circumstances of work-related homicides indicates that the overall decline was primarily driven by substantial reductions in

Type I workplace homicides (those that occurred during the course of a robbery or another crime) and that this reduction mirrored the decline in robbery-related homicides in the general U.S. population. Detailed analysis of the trends in workplace homicides by occupation, industry, worker activity, and location also support the notion that the overall decline in workplace homicides during this period was primarily driven by substantial reductions in robbery-related homicides.

Risk Factors and Prevention Strategies

Findings from the occupational safety and health and criminal justice literature can be brought together to identify several potential risk factors for workplace violence, including the following:

- Interacting with the public
- Exchange of money
- Working alone or in small numbers
- Working late night or early morning hours
- Guarding valuable property and/or possessions
- Delivery of passengers, goods, and services
- Having a mobile workplace (e.g., police cruiser or taxicab)
- Working in community-based settings
- Working with unstable or volatile persons in health care, social service, or criminal justice settings
- Working in high-crime areas

Although many of these risk factors are inherent in particular industries and occupations, the number and impact of incidents can be reduced through the implementation of appropriate prevention strategies. Such strategies can be grouped into three overarching categories—environmental designs, administrative controls, and behavioral strategies.

Environmental Designs

Environmental design approaches to workplace violence prevention are consistent with more general principles of crime prevention through environmental design and include strategies such as interior and exterior lighting and making high-risk areas more visible to more people. This increased visibility may be referred to by

criminologists or security experts as natural surveillance, and it may be accomplished by removing signage from the windows of convenience stores or by using the glass-walled interview areas in banks, emergency departments, and other settings where privacy is needed for the exchange of personal information, but the interaction can reasonably be observed by other workers as well as clients and patients.

Other environmental design strategies focus on physical separation of workers from customers, clients, and the general public. The use of bullet-resistant barriers or enclosures has been suggested for retail settings such as gas stations or convenience stores, banks, hospital emergency departments or pharmacies, and social service claims areas. Increasing the height and depth of counters—with or without bullet-resistant barriers—is also a possible consideration to protect workers by introducing physical distance between workers and potential attackers. Thought must be given, however, to the continued ease of conducting business because a safety device that increases frustration for workers or for customers, clients, or patients may be self-defeating. Cash-control strategies are another important component of environmental design considerations. Using cash-control devices such as drop safes to minimize cash accessible to workers and posting signs stating that limited cash is on hand are considered prudent strategies for many retail settings.

Access to and egress from the workplace are also important environmental design concerns to address. The number of entrances and exits, the ease with which nonemployees can gain access to work areas because doors are unlocked, and the number of areas where potential attackers can hide are important considerations. This has implications for the design of buildings and parking areas, landscaping, and the placement of garbage areas, outdoor or stand-alone refrigeration units, and other storage facilities that workers must access during a work shift.

The installation of numerous security devices may reduce the risk for assaults against workers and/or facilitate the apprehension of perpetrators. These devices include closed-circuit cameras, alarms, two-way mirrors, card-key or other biotechnological access systems, panic-bar doors locked from the outside only, or personal alarm

devices in fixed workplaces. For mobile workers, trouble lights, cell phones, geographic positioning systems, or other tracking or help-summoning technologies may be appropriate. In addition, personal protective equipment such as body armor is appropriate in law enforcement and other public safety or security occupations.

Administrative Controls

Staffing plans and work practices (such as escorting patients and prohibiting unsupervised movement within and between clinic areas) are included in the 1993 California Occupational Safety and Health Administration *Guidelines for the Security and Safety of Health Care and Community Service Workers*. Increasing the number of staff on duty may also be appropriate in any number of service and retail settings. The use of security guards or receptionists to screen persons entering the workplace and controlling access to actual work areas has also been suggested by security experts.

Work practices and staffing patterns during the opening and closing of establishments and during money drops and pickups should be carefully reviewed for the increased risk of assault they pose to workers. In addition to the transportation or depositing of money, these practices may include having workers take out garbage, dispose of grease, and/or store food or other items in external storage areas.

Policies and procedures for assessing and reporting threats allow employers to track and assess threats and violent incidents in the workplace. Such policies clearly indicate that workplace violence is unacceptable and provide mechanisms by which incidents can be reported and handled. In addition, such information allows employers to assess whether prevention strategies are appropriate and effective. These policies should also include guidance on recognizing the potential for violence, methods for defusing or de-escalating potentially violent situations, and instruction about the use of security devices and protective equipment. Procedures for obtaining medical care and psychological support following violent incidents should also be addressed. Training and education efforts are clearly needed to accompany such policies.

Behavioral Strategies

Training employees in nonviolent response and conflict resolution has been suggested to reduce the risk that volatile situations will escalate to physical violence. Also critical is training that addresses hazards associated with specific tasks or worksites and relevant prevention strategies. Training should not be regarded as the sole prevention strategy but as a component in a comprehensive approach to reducing workplace violence. To increase vigilance and compliance with stated violence prevention policies, training should emphasize the appropriate use and maintenance of protective equipment, adherence to administrative controls, and increased knowledge and awareness of the risk of workplace violence.

The first priority in developing a workplace violence prevention policy is to establish a system for documenting violent incidents in the workplace. Such data are essential for assessing the nature and magnitude of workplace violence in a given workplace and for quantifying risk. These data can be used to assess the need for action to reduce or mitigate the risks for workplace violence and implement a reasonable intervention strategy. An existing intervention strategy may be identified within an industry or in similar industries, or new and unique strategies may be needed to address the risks in a given workplace or setting. Implementation of the reporting system, a workplace violence prevention policy, and specific prevention strategies should be publicized across the workplace and appropriate training sessions should be scheduled. The demonstrated commitment of management is crucial to the success of the program. The success and appropriateness of intervention strategies can be monitored and adjusted with continued data collection.

A written workplace violence policy should clearly indicate that violence, whether it originates inside or outside the workplace, or is committed by line or supervisory staff, will not be tolerated. Just as workplaces have developed mechanisms for reporting and dealing with sexual harassment, they must also develop threat assessment teams to which threats and violent incidents can be reported. These teams should include representatives from human resources, security, employee assistance, unions, workers, management, and perhaps legal and public relations departments. The charge to

this team is to assess threats of violence (e.g., to determine how specific a threat is, whether the person threatening the worker has the means for carrying out the threat, etc.) and to determine what steps are necessary to prevent the threat from being carried out. This team should also be charged with periodic reviews of violent incidents to identify ways in which similar incidents can be prevented in the future.

Note that when violence or the threat of violence occurs among co-workers, firing the perpetrator may or may not be the most appropriate way to reduce the risk for additional or future violence. The employer may want to retain some control over the perpetrator and require or provide counseling or other care, if appropriate. The violence prevention policy should explicitly state the consequences of making threats or committing acts of violence in the workplace; typically, this is some sort of progressive discipline (e.g., a verbal or a written warning, followed by disciplinary action up to and including removal) depending on the seriousness of the incident. If someone poses a danger to himself or others, appropriate authorities should be notified and action should be taken immediately.

A comprehensive workplace violence prevention policy and program should also include procedures and responsibilities to be taken in the event of a violent incident in the workplace. This policy should explicitly state how the response team is to be assembled and who is responsible for immediate care of the victim(s), re-establishing work areas and processes, and organizing and carrying out stress debriefing sessions with victims, their co-workers, and perhaps the families of victims and co-workers. Employee assistance programs, human resource professionals, and local mental health and emergency service personnel can offer assistance in developing these strategies.

Dealing With the Consequences of Workplace Violence

Since the late 1980s, much discussion has centered on the role of stress in workplace violence. Of note, stress can be both a cause and an effect of workplace violence. That is, high levels of stress may lead to violence in the workplace, but a violent incident in the workplace will most certainly

lead to stress, perhaps even to posttraumatic stress disorder. Employers and others who provide training or services to workplaces should therefore be sensitive to the effects of workplace violence and provide an environment that promotes open communication; they should also have in place an established procedure for reporting and responding to violence. Appropriate referrals to employee assistance programs or other local mental health services may be appropriate for stress debriefing sessions after critical incidents.

Conclusion

Currently, no national regulatory requirements specific to the prevention of workplace violence are in place. In the United States, occupational safety and health legislative responsibility is delegated to the Occupational Safety and Health Administration in the U.S. Department of Labor. The National Institute for Occupational Safety and Health in the U.S. Department of Health and Human Services is the designated federal research agency. Both agencies have addressed the importance of preventing workplace violence. Other federal agencies such as the Federal Bureau of Investigation and the Office of Personnel Management have also developed materials and recommendations for workplace violence prevention. Employers, workers and labor representatives, academic researchers, and numerous professional associations have also been engaged in research and advocacy efforts. Given the complexity of the problem, there may never be a single legislative or preventive approach to workplace violence but a collection of efforts to address the component parts of the overall issue.

WORKPLACE VIOLENCE AND BULLYING, INTERVENTIONS FOR

Workplace violence encompasses a broad array of physical and nonphysical behaviors intended to harm individuals while they are on the job. The workplace is considered any location where an employee performs a work-related task or duty. Acts of violence such as physical assaults or threatening behaviors represent a significant health and safety risk to workers. The Bureau of Justice Statistics indicates that around 1.7 million workers in the United States are the victims of workplace assaults, and that homicide is now the fourth leading cause of death while on the job.

Workplace bullying refers to situations where employees are subjected to frequent, persistent mistreatment that includes overtly aggressive or hostile behaviors (e.g., being pushed or being yelled at) as well as more covert or passive acts such as being ignored, being undermined, being lied to, belittling, exclusion or social isolation, withholding information, and sabotage.

Several factors have been shown to be associated with workplace violence, including contact with the public, exchanging money, working at night, transporting passengers, delivering goods or services, working alone or in small numbers, and working with potentially violent or unstable individuals. Workplace bullying has been shown to be associated with poor organizational climate, lack of organizational justice, role conflict, high workload, interpersonal conflicts, lack of social support, and leadership style. Workers in health care, law enforcement, retail trades, and social and other service professions are particularly at risk for workplace violence and bullying.

Interventions for Workplace Violence

General workplace violence prevention programs may include written company policies, multidisciplinary teams to develop prevention strategies, and training explicitly on workplace violence. Specific prevention strategies for workplace violence can be categorized as environmental, administrative, and behavioral interventions.

Environmental designs geared at preventing workplace violence include cash-control and

cash-handling policies (locked drop safes, maintaining small amounts of cash, and posting signs saying that there is limited cash); physically separating the worker from customers/clients (barriers, bullet-resistant partitions or enclosures, and increasing the height and depth of counters or workspace between worker and customer); increasing visibility and lighting; entry and exit control; surveillance cameras; alarms; keycard access systems; trouble lights; personal protective equipment; and geographic locating devices for mobile workers such as law enforcement officers and taxi drivers.

Administrative controls include adequate staffing, work practices (escorting visitors or clients/customers/patients), utilization of security personnel and screening, opening and closing procedures, money drop or pickup procedures, restricting hours of operation, and implementing policies and procedures for threat assessment and reporting.

Behavioral interventions include training employees on risk awareness, conflict resolution, de-escalation techniques, interpersonal skills and communication, dealing with potentially aggressive persons, use of protective measures or equipment, and proper restraint and takedown methods for law enforcement personnel.

Secondary and tertiary interventions for the aftermath of a violent incident may include psychological first aid, employee assistance programs (EAPs) or community mental health resources, training on coping strategies and stress management, as well as the use of human resources (HR) or occupational health and wellness services.

Interventions for Workplace Bullying

Similar to the above approaches for workplace violence, it has been suggested that both supervisors and employees receive training in conflict management, de-escalation techniques, and specific awareness training for workplace bullying. On an organizational level, it has been recommended that organizational policies, roles and responsibilities, and guidelines for appropriate and acceptable behavior be clearly stated and communicated throughout all levels of the organization. Some researchers have suggested that workplace bullying can be prevented by creating a climate that fosters and encourages openness, respect, and tolerance of diversity, and

that management practices should promote fair treatment and respect for all employees.

Secondary and tertiary interventions that might mitigate the adverse effects of workplace bullying include training on coping strategies, stress management, EAPs or outside mental health resources, utilizing the formal complaint or grievance system, use of HR professionals, occupational health and wellness programs, or using informal response teams.

Evaluative Research

Although there has been a great deal of surveillance research on workplace violence and bullying, it is important to note that there are still relatively few evaluative studies of intervention effectiveness, and the work that has been done has concentrated on specific occupations and industries. Moreover, general prevention strategies developed in one context may or may not transfer to different occupational settings or environments. Systematic intervention evaluation remains a significant research need.

Y

YOUTH CENTERS

Youth centers are social and recreational centers that provide specialized services geared toward children ranging in age from around 6 to 18 years. Some youth centers offer programs for children as young as 3 years. These services often include, but are not limited to, counseling, mental health, substance abuse, education, creativity, leadership, and physical health programs. Often the programs at youth centers are offered for free or at a low cost to encourage participation by the community. Many youth centers are located in inner cities and focus on youth that are disadvantaged and considered to be at risk for delinquency or socially undesirable behaviors. Youth centers frequently host after-school programs and early childhood programs as a way to try to redirect at-risk youths. If youths are involved in programs in the center, they are off the streets and away from potentially dangerous environments.

Overview of Programs

Substance Abuse and Mental Health Counseling Programs

Substance abuse and mental health counseling services are provided at some youth centers. A wide range of services may be offered, including individualized assessment, treatment, family counseling, behavioral therapy, and small group therapy. Some youth centers may specialize in substance abuse treatment while offering other programs in

conjunction, such as educational and recreational programs. These programs are intended to provide therapy for youths while also supplementing other areas of the youth's life under a supervised environment.

Mental health programs may be provided along with substance abuse programs or by themselves. These programs can focus on several mental health issues such as aggression, depression, anxiety, and other mental health disorders. Counseling services, both one-on-one and in a group setting, are common when mental health programs are offered. Mental health programs may contain cognitive and behavior activities geared toward treating the problem and building skills for use outside the youth center environment.

Educational Programs

At the core of many youth centers are their educational programs. These programs are intended to give academic enrichment to youths through activities such as mentoring, role modeling, and one-on-one tutoring. Educational programs strive to build the character, strengths, talents, and skills of youths struggling to keep up in school through positive learning environments. Youth centers that provide educational programs regularly may have specific rooms for homework, tutoring classes, and computer use.

Early educational programs may also be offered under the umbrella of educational programs. The purpose of these programs is to provide a head start for children who may have developmental problems in school or who may have learning

deficits. Early education programs may start with children as young as 3 years of age to supplement learning early.

Leadership Programs

Programs that teach leadership skills are commonly offered for older children in their teens at youth centers. Teens are taught through leadership activities problem solving, communication, and self-esteem. These activities could include wilderness retreats where youths are challenged to use their leadership skills to navigate and build confidence. These leadership skills are taught with the hope that they will translate into use in future experiences.

Physical and Nutritional Health Programs

Physical and nutritional programs are administered to help with the growing problem of childhood obesity. Programs that encourage exercise through sports are at the cornerstone of many youth centers. Soccer, basketball, tennis, baseball, football, and swimming, to name a few, are offered for all age ranges and are highly promoted. Physical education through sports is also used to get at-risk youth off the streets and into conventional activities. Programs focused on nutritional health are frequently provided under the range of health services available at the center. Classes are held that provide information to youths and their parents about diet and nutritional information.

Creativity Programs

Creativity programs offered at most youth centers attempt to give youth a way to explore their creative and artistic sides through activities such as drawing, painting, writing, music, theatre, and dance. These programs can also help with self-esteem and encourage free thinking and expression of ideas. Specialized rooms for artistic activities are common, and youth centers typically are filled with paintings, drawings, and writings of those who attend.

After-School Programs

Youth centers that provide after-school programs strive to keep youth engaged in conventional activities through creative and physical outlets. These types of programs take place directly after school ends

and provide youths with a place to go instead of home alone or on the streets. After-school programs can include many of the programs discussed above and usually last until around 6 p.m.

Empirical Support

Few studies have been conducted to examine the effectiveness of youth centers in providing at-risk children with a place to escape from the dangers often encountered in their everyday lives. Of the studies that have been conducted the results are promising. Children who regularly attend programs provided by youth centers scored higher on achievement, emotional regulation, and attitudes toward school. These children were also less likely to engage in delinquent activities such as graffiti, shoplifting, or vandalism. Over time, the impact of the youth center increased with those who attended the youth center the longest and most frequently the least likely to engage in socially undesirable behaviors.

YOUTH CRIME PREVENTION INITIATIVES, INTERNATIONAL

Youth crime and violence prevention has been well studied and evaluated for many years in developed regions of the world such as North America and Europe. In other regions, however, the size of the problem of youth violence, its seriousness, as well as the capacity of criminal justice systems or governments to deal with it are very different. What has been taking place in recent years is a recognition that a more public health approach to youth violence, and social and economic understanding of its causes, are required to reduce its incidence.

The World Health Organization estimates that 199,000 youth murders took place in 2000, with around 565 children and young people aged 10 to 29 years dying each day of the year. Most perpetrators of this violence are young men aged 15 to 25 years of age, and they are also the majority of the victims of that violence. In some regions of the world, notably in Africa and Latin America and the Caribbean, violence associated with young people has reached extraordinary levels. In Brazil, for example, the rate of homicides among young people in one *favela* in São Paulo is 438 per 100,000, compared with 27 for Brazil as a whole, or 5.9 per 100,000 for the United States and 2.03 for the United Kingdom. Such violence occurs disproportionately in low- and middle-income countries. Although developed countries have experienced some decline in youth violence in the past 10 years, this has not been the case in developing countries or those in transition to development.

The risk factors for violence and crime are similar across regions and countries: poverty and inequality of income, poor environment, harsh or erratic parenting, early aggressive behavior, parental conflict and family violence, dropping out of school, and lack of jobs and employment opportunities. Facilitating factors include access to drugs and guns. But what is unequal is the extent of exposure to those risk factors among children and young people in different regions. Rapid urbanization, the growth of megacities and slums without the necessary infrastructure to support their residents, and an increase in the

proportion of children and young people, especially among the urban poor, have all contributed fertile ground for the recruitment of young people into groups and gangs associated with local crime and violence.

Transnational organized crime, trafficking in small arms, drugs and persons, as well as war and conflict have all facilitated the recruitment of children and young people into groups and gangs (and in some cases militia), and they have exacerbated the associated violence. Studies of youth gangs in South Africa, Nigeria, Brazil, and Central America, among other places, have demonstrated the existence of *organized armed violence*, which has become institutionalized, with strong social and economic ties to local communities. In such cases, taking a hard repressive approach, using tougher laws and policing, more punitive sentencing, and longer incarceration may provide short-term solutions, but it does not “work” to prevent future problems, and it is enormously expensive. Too many other children are growing up in similar circumstances.

What is clear is that the complexity of youth violence in terms of its causes, and the wide variety of forms it takes in different countries and regions, means that no simple or single approach is going to provide lasting and sustainable solutions. Internationally, there is now an emerging consensus, supported by the UN *Guidelines for the Prevention of Crime* adopted in 2002 (ECOSOC Resolution 2002/13), that the best, most effective, and lasting response to youth violence is to develop *a balanced and strategic prevention approach*. This approach includes strengthening local communities, changing attitudes toward violence and gun use, offering education and training and employment alternatives to young people growing up, and working with those young people who are already immersed in a violent gun culture to help them return to a safer and healthier way of life. It requires a multidisciplinary or interdisciplinary approach, with a *broad and comprehensive coalition of partners*, especially at the local level, and it is grounded in a broad *public health and community safety* perspective.

Thus, the emphasis is on *how* to work, as much as on *what* to do, using inclusive and participatory approaches that reduce youth marginalization; integrated multisectoral strategies; balanced strategies

that include early intervention, social and educational programs, restorative approaches, and crime control; targeted and tailored strategies and programs to meet the needs of specific at-risk groups; and approaches that respect the rights of children and young people. Such approaches have also been shown to be more cost-effective and cost-beneficial than suppression or deterrent approaches. Examples of effective projects that have reduced youth violence include *Fica Vivo*, in the State of Minas Gerais, which was inspired by the Boston gun project but was adapted to local needs and capacities. The work of the *AffroReggae Cultural Group* in Rio de Janeiro, Brazil, has worked to change the attitudes of both the police and young people to each other. Khulisa, an organization in South Africa, runs a range of programs aimed at youth violence prevention in custodial institutions and the community, and the *Proudly Manenburg Initiative* in Cape Flats, South Africa, is a project that involves the community working closely with the police and local authority as well as with the young people themselves in a township with very high levels of youth gang membership and violence. What is important is that these projects have been built and adapted to the local context and capacities, using a good knowledge-based approach.

Overall, therefore, many initiatives now recognize the complex nature of youth violence and victimization, especially among the most vulnerable groups in cities. They are focusing on building the skills and resilience of these young people and on building local programs that provide support, provide the skills and education for sustainable livelihoods, and include many projects and programs initiated and led by young people as full participants.

YOUTH CRIME PREVENTION INITIATIVES, UNITED STATES

Protecting youth from crime is one of our society's most critical priorities. Many communities have experienced an increase in youth drug use, the active involvement of youth in street gangs, and an increase in youth engagement in and exposure to criminal activity. Today, many youth are allowed to control their daily activities without supervision. These youth are more at risk for involvement in delinquent behavior or victimization than youth who are supervised by adults. Recent technology developments have benefited our society, but they have also made access to youth easier for predators and other criminals. Several initiatives have been used to provide opportunities for youth to avoid involvement in delinquent behavior and victimization.

Gang Resistance Education and Training Program

The Gang Resistance Education and Training Program (G.R.E.A.T.) Program is a school-based, law enforcement officer-led classroom curriculum, intended to help youth avoid delinquency, violent activity, and gang membership. The primary objective of the program is prevention, and lessons focus on providing life skills to students so they can avoid delinquent behavior and the use of violence to solve problems. The G.R.E.A.T. Program is administered by the Office of Justice Programs, as part of the Bureau of Justice Assistance.

Gang Reduction Program

The Office of Juvenile Justice and Delinquency Prevention (OJJDP) designed its Gang Reduction Program to reduce gang activity in targeted neighborhoods. The program incorporates a variety of interventions to address personal, family, and community factors that contribute to delinquency and gang activity. The program integrates federal, state, and local resources with prevention, intervention, and suppression. The program was piloted in Los Angeles, California; Milwaukee, Wisconsin; North Miami Beach, Florida; and Richmond, Virginia. These communities were selected because they had significant existing program investment, strong indicators of citizen involvement, and high rates of crime and gang activity.

Juvenile Accountability Block Grants Program

The Juvenile Accountability Block Grants Program (JABGP) provides funds to state governments for programs promoting greater youth offender accountability in the juvenile justice system. Funds may only be used in support of the Juvenile Accountability Block Grant program purpose areas, including supporting juvenile drug and gun courts; enhancing school safety; instituting graduated sanctions for offenders; training programs for preventing and controlling crime; implementing early identification, control, supervision, and treatment efforts; and establishing and maintaining restorative justice programs. The JABGP is also administered by the OJJDP.

National Crime Prevention Council

The National Crime Prevention Council's Teens, Crime, and the Community (TCC) initiative was designed to create safer schools and neighborhoods. The TCC's Community Works program helps youth understand how crime affects them and their families, friends, and communities, and it involves them in crime prevention projects to help make their communities safer. Community Works educates youth about the costs and consequences of crime, their rights and responsibilities as citizens, and the ability to bring about meaningful change through advocacy and service. The core lessons of Community Works teach youth how to examine violence and law-related issues in the context of their schools and communities and apply what they learn to real-life circumstances. Additional lessons tackle important youth-related issues, including underage drinking, handguns and violence, substance abuse and drug trafficking, gangs, dating violence, conflict management, and police-youth relations. The TCC's Youth Safety Corps provides youth interested in public safety and crime prevention an opportunity to engage in ongoing, active participation in crime prevention. Youth in the program can partner with school resource officers, school personnel, and community volunteers to assess and analyze safety and security issues within their schools and communities that contribute to youth violence and victimization.

Online Crime Prevention Efforts Involving Youth

For many youth, creating a profile on a social networking Web site like Facebook or MySpace is a right of passage. These pages often contain personal and intimate details, photographs, hobbies and interests, and even phone numbers, email addresses, and where they go to school. Many parents do not understand how to monitor the use of these sites and often cannot view the content because the sites are protected by a password. These sites may increase the exposure of youth to delinquency and victimization. Even if a physical address, email address, or phone number is not listed, youth often provide enough information for a pedophile to use to start a relationship over the Internet, and many freely connect with people with whom they have no

established face-to-face connection. The power of the connections on these social networking sites is being examined by the United States government. The U.S. State Department is exploring a program to enlist online youth groups to fight crime, political oppression, and terrorism. Joining with Facebook, Google, MTV, Howcast, and others, the State Department is hoping to enlist more eyes and ears in these endeavors.

Project Safe Neighborhoods

The Department of Justice Project Safe Neighborhoods initiative was designed to combat gang violence. The strategy prioritizes prevention programs to provide youth and offenders returning to the community with opportunities that help them resist gang involvement and ensures robust enforcement policies when gang-related violence occurs.

Youth at Risk

The American Bar Association (ABA) Commission on Youth at Risk program was designed to find ways for the legal community to identify and support America's at-risk youth. To lead this initiative, the ABA Commission identified the challenges facing youth and began working to enhance laws, judicial intervention strategies, policies, practices, and programs to help prevent them from becoming delinquent or engaging in criminal acts. The ABA focused on the following:

- Finding better ways to serve youth "status offenders"
- Meeting the needs of youth who become ineligible for needed services
- Ensuring more meaningful participation by youth in court proceedings
- Enhancing youth access to services in their community, especially youth with emotional, behavioral, or other mental health issues
- Better supporting youth living in chaotic and violent homes, and those experiencing high-conflict family breakup
- Improving how legal and court interventions affect youth who progress from one at-risk status to another

YOUTH VIOLENCE, INTERVENTIONS FOR

Although not as high as crime rates in the early to mid-1990s, a recent increase in violent crimes committed by juveniles has prompted researchers, criminal justice personnel, and communities to develop and implement *interventions* designed to modify the behaviors of young people as a means of crime and violence prevention. For example, according to recent figures, juvenile arrests for violent index crimes (i.e., murder and non-negligent manslaughter, forcible rape, robbery, and aggravated assault) have increased with nearly 30% of the violent index crimes attributable to youth offenders. This entry highlights some of the major concepts, practices, and programs that have either already demonstrated their effectiveness or show potential for curbing youth violence.

Conceptually, researchers have concentrated on the factors that place youth at jeopardy for violence (i.e., risk factors), and those factors that can insulate youth from violence (i.e., protective factors). For example, children with parents who are effective at monitoring and disciplining problem behaviors are less likely to engage in delinquency. The converse of this is also evident. Children whose parents were not effective at monitoring and discipline have an increased likelihood of engaging in problem behaviors. Under the risk and protective factors framework, the manner by which factors are experienced by youth is contingent on the context in which they operate and interact across ecological levels (i.e., individual, family, school, and community). Some of the major risk factors found to affect violent offending significantly are ineffective parenting, lack of mutual attachments and nurturing, failure in school, poor social coping skills, affiliations with deviant peers, abuse, and disorganized neighborhoods. Protective factors include success in school, strong and positive bonds with family, clear rules of conduct consistently enforced at home and school, strong attachments to prosocial institutions such as schools and religious organizations, and low residential mobility in neighborhoods. Various interventions have been developed to target these factors in order to reduce crimes of violence committed by juveniles.

The list of interventions used to address youth violence is long. Evaluation studies of many of these programs have revealed that certain practices are more effective than others. In general, success has been found for programs that employ individual counseling, interpersonal skills training, as well as cognitive and behavioral strategies, and for those that offer multiple types of services. Tactics that have demonstrated little effect on juvenile violent offending include deterrence-based, vocational, and wilderness or challenge programs. Since risk and protective factors operate at all ecological levels, interventions that yield the most benefit are those that target as many of the risk and protective factors across as many of these contexts as possible. Furthermore, strategies that teach juveniles how to resolve conflict nonviolently, mobilize the community, and provide positive adult role models have been shown to have a significant impact on the reduction of youth violence.

Several interventions have stood out as being effective in the reduction of violence: functional family therapy (FFT), multisystemic therapy (MST), children at risk (CAR), and communities that care (CTC). Although space precludes a detailed examination, several key components of these programs illustrate why they have established their efficacy in the reduction of violent behaviors. In general, these programs provide counseling or interaction with youths' families in some shape or form. FFT, for example, makes use of behavioral modification approaches and encourages families to work together to affect positive change in high-risk children who are angry and hopeless and often are difficult to treat using traditional approaches. MST assists parents by helping them identify their weaknesses in parenting such as substance use and/or mental health issues. The MST program also provides treatment in the home, community, and school, thereby addressing such risk factors as negative peer associations, problems at school, and ineffective parenting.

The CAR program also focuses treatment at several ecological levels, recognizing that individuals are embedded in several contexts and influenced by any number of factors that interact with one another to influence behavior. As such, CAR tailors its strategies to address the primary needs of youth by providing such practices as peer tutoring, mentoring, family skills training, and after-school activities at the community level. Based predominantly on the risk-protective factors paradigm is the CTC, which is also tailored to each community it serves. Assessments of schools, neighborhoods, and available social service agencies are conducted to determine what strategies need to be in place to strengthen protective factors and weaken risk factors, thereby reducing violence and delinquency. Components that have been included in CTC to address negative behaviors have included job and life skills training, family therapy, organizational change in schools, and after-school recreation programs.

The items detailed above are by no means exhaustive of the interventions used to deal with youth violence. Indeed, many efforts seek to reduce and prevent juvenile violence. Many localities have developed programs and are finding success by using many of the strategies established by research to be effective. Some communities have also

received grant support from the federal government in this regard.

Appendix: Resources

The resources listed below have been divided into five categories: crime prevention, government agencies and organizations, electronic research resources and materials, victimization, and victims of crime. Within each of these categories, readers will find the resources further subdivided by specific topics for ease of use. Where appropriate, each resource's full contact information is listed, including street address, phone numbers, fax number, email address, and Web site address. The purpose of each resource is described, as well as the types of materials and/or services that it offers. The reader is encouraged to directly contact a respective resource or visit its Web site to obtain further relevant information.

Crime Prevention

General Information Resources

Center for Problem-Oriented Policing

The Center for Problem-Oriented Policing was created to advance the idea and practice of problem-oriented policing. It seeks to fulfill this mission by making available information and tools that police can use to effectively address specific crime problems. The "popcenter" is composed of police practitioners, researchers, and academics committed to the development and improvement of problem-oriented policing.

Web site: <http://www.popcenter.org>

Community Capacity Development Office, Department of Justice

The Community Capacity Development Office (CCDO) is housed in the Office of Justice Programs at the United States Department of Justice. CCDO works toward revitalizing communities and reducing crime by promoting ways for communities to increase quality of life and reduce drug problems.

810 Seventh Street NW
Washington, DC 20531

International Symposium on Environmental Criminology and Crime Analysis

The International Symposium on Environmental Criminology and Crime Analysis (ECCA) has no office, staff, or president. It has no official membership list. It is a social network of interested parties who meet at an annual conference. Volunteers run conferences, and the next conference is determined by who volunteers. To get invited to a conference, you had to have attended one of the last two conferences or know someone who did. Meetings roam the globe and are never in the same country twice. ECCA has

no permanent Web site or permanent anything, although Ron Clarke at Rutgers University can be reached for more information.

UCL Jill Dando Institute of Crime Science

The UCL Jill Dando Institute of Crime Science is the first of its kind, with a specific emphasis upon crime reduction and prevention. The institute seeks to change the way crime and the practice of responding to crime are approached by highlighting evidence-based research and analysis. To this end, the institute examines patterns in crime and seeks out practical tactics and methods to

change these patterns by bringing together criminal justice professionals, designers, scientists, and politicians.

Victimization

Crime and Victimization Statistics

United States

National Crime Victimization Survey

Administered by the Bureau of Justice Statistics, the National Crime Victimization Survey (NCVS) is a national-level survey in the United States designed to measure the extent of certain types of victimization that residents age 12 and older and their households experience each year. The NCVS reports on sexual assaults, rapes, assaults, robberies, household burglaries, thefts, and motor vehicle theft victimizations. Topical supplements to the NCVS have been conducted and cover a variety of topics (e.g., victimization in schools).

Web site: <http://www.ojp.usdoj.gov/bjs/cvict.htm>

National Incident-Based Reporting System

An effort to redesign the Uniform Crime Reporting (UCR) Program to make it more comprehensive was undertaken by the Bureau of Justice Statistics and the FBI in 1982. The redesign resulted in more comprehensive and detailed crime statistics, with data being collected on each reported crime incident. This new and expanded crime reporting system is the National Incident-Based Reporting System (NIBRS) and includes information on 46 specific offenses (including Part I crimes) and 11 lesser offenses.

Web site: <http://www.ojp.gov/bjs/nibrs.htm>

See also National Archive of Criminal Justice Data (p. 1099)

Sourcebook of Criminal Justice Statistics

The Sourcebook of Criminal Justice Statistics provides information about several aspects of criminal justice in the United States, including criminal justice characteristics (e.g., corrections, courts), public opinion, crime and victims, arrests, sentencing, parole, jails, the death penalty, and more. Data in the sourcebook come from more than 100 sources and are presented in more than 1,000 tables.

Web site: <http://www.albany.edu/sourcebook>

Uniform Crime Reports

The Uniform Crime Reporting (UCR) Program, which today is run by the FBI, is carried out with the purpose of

collecting, publishing, and archiving crime statistics in the United States. The program publishes statistics annually that are produced from data provided by nearly 17,000 law enforcement agencies across the United States. The UCR Program has been ongoing since 1929.

Web site: <http://www.fbi.gov/ucr/ucr.htm>

International—Multiple Countries

International Crime Victims Survey

Conducted since 1989, the International Crime Victimization Survey (ICVS) is a victimization survey designed to assess victimization and other crime-related topics across the world. The ICVS measures a variety of types of victimization, such as motor vehicle theft, burglary, hate crimes, consumer fraud, and many others. A number of countries have participated in the ICVS since 1989, including Australia, Finland, Japan, and Mexico.

Web site: <http://rechten.uvt.nl/icvs>

International Violence Against Women Survey

Modeled after the International Crime Victims Survey and relying on the network, infrastructure, and methodology employed in the ICVS, the International Violence Against Women Survey (IVAWS) is an international survey designed to measure the extent of men's violence against women, especially domestic violence and sexual assault.

See also The European Institute for Crime Prevention and Control with the United Nations (p. 1097)

International—Country Specific

Australian Institute of Criminology

The Australian Institute of Criminology is Australia's national agency on research related to crime and justice. The institute seeks to reduce crime and uphold justice by conducting and disseminating evidence-based research to inform policy and practice.

Web site: <http://www.aic.gov.au>

British Crime Survey

The British Crime Survey (BCS) is a survey that measures the amount of crime in England and Wales by asking residents about their crime-related experiences in the previous year. The BCS provides information on a variety of crime-related topics such as public attitudes regarding crime, fear of crime, and measures undertaken to avoid crime. The BCS provides an alternative to official records because it includes crimes that were not reported to the police.

Web site: <http://www.homeoffice.gov.uk/rds/index.html>

Statistics Canada

Statistics Canada is a resource that provides statistics and information on a variety of topics (e.g., environment, culture, agriculture, aboriginal peoples) in Canada, including the administration of civil and criminal justice and the nature and extent of crime.

Web site: <http://www.statcan.gc.ca>

Professional Organizations**American Society of Victimology**

The American Society of Victimology (ASV) seeks to further the study of victimization and advancement of the field of victimology by focusing on research and education.

Chronology

Circa 2000 BCE	Ancient Babylonian Code of Hammurabi outlines responsibilities of individuals to take action against offenders when victimized— <i>lex talionis</i> (an eye for an eye).
1066 CE	After the Norman Conquest, policing becomes obligatory for all men in England.
1285	Statutes of Winchester codify ideas of “watch and ward” and “hue and cry” that mandate male participation in responding to crime.
1829	Metropolitan Police Act establishes police force in London with primary goal of crime prevention.
1899	Juvenile Court in Cook County, Illinois, which includes Chicago, is established as a means of preventing problems that lead youth to become offenders.
1930	FBI and International Association of Chiefs of Police (IACP) begin national data collection efforts for the Uniform Crime Reporting (UCR) Program in the United States.
1931	Chicago Area Project is established and works to improve communities so that they no longer attract criminal activity.
1948	<i>The Criminal and His Victim</i> by Hans von Hentag is published, which turns attention from offenders to victims and suggests that characteristics of victims may contribute to their victimization.
1955	First United Nations Crime Conference is convened (and a conference is held every 5 years thereafter).
1956	Benjamin Mendelsohn, considered the father of victimology, develops typology of victims.
1958	<i>Patterns in Criminal Homicide</i> by Marvin E. Wolfgang argues that victims often precipitate their victimization.
Mid-to-late 1960s	Women’s movement arises and helps champion victim issues.
	Children’s movement arises to address childhood victimization and rights.
	First victimization surveys are developed.
1961	Jane Jacob’s <i>The Death and Life of Great American Cities</i> , which discusses urban design as a contributor to criminal activity, is published.
1962	C. Henry Kempe and his colleagues introduce the term <i>battered-child syndrome</i> .
1963	New Zealand passes first victim compensation legislation.
1964	Great Britain passes victim compensation legislation.

1965	First U.S. crime victim compensation program is established in California.
1967	President's Commission on Law Enforcement and Administration of Justice publishes its reports.
	National Opinion Research Center reports on early victimization survey showing roughly twice as much crime as found in police data.
1968	<i>The Victim and His Criminal</i> by Stephen Schafer is published, introducing the concept of functional responsibility of victims.
1970s	Dispute resolution reemerges as an alternative to court.
	Beginnings of modern restorative justice emerge.
	Crime prevention through environmental design (CPTED) is developed.
	Neighborhood Watch—a community-based crime reduction program—is introduced.
1971	Menachen Amir writes <i>Patterns of Forcible Rape</i> , which examines victim precipitation in the acts.
	C. Ray Jeffery's <i>Crime Prevention Through Environmental Design</i> is published, introducing the idea that the social and physical environments are sources for preventing crime.
	United Nations Committee on Crime Prevention and Control is formed.
1972	First three victim assistance programs are created.
	National Crime Survey (NCS) is launched.
	Oscar Newman's <i>Defensible Space</i> outlining design methods to prevent crime is published.
1974	Federal Law Enforcement Assistance Administration funds the first Victim/Witness Programs in the Brooklyn and Milwaukee District Attorneys' offices.
1975	National Organization for Victim Assistance (NOVA) is formed.
1976	James Rowland creates the first victim impact statement.
	Thomas Reppetto introduces the idea of <i>crime displacement</i> .
	Crime Stoppers—a partnership of the community, law enforcement, and media—is established for identifying and capturing offenders.
1977	The National Association of Crime Victim Compensation Boards is formed.
	Oregon becomes the first state to enact mandatory arrest in domestic violence cases.
1978	The National Coalition Against Sexual Assault (NCASA) is formed.
	The National Coalition Against Domestic Violence (NCADV) is organized.
	Michael Hindelang, Michael Gottfredson, and James Garofalo publish <i>Victims of Personal Crime: An Empirical Foundation for a Theory of Personal Victimization</i> , which introduces the idea that an individual's lifestyle contributes to victimization.
1979	Redesign of the National Crime Survey is launched.
	Lawrence Cohen and Marcus Felson introduce <i>routine activity theory</i> , which offers insight into the time and place of offending.

(Continued)

(Continued)

1980	Wisconsin passes the first Crime Victims Bill of Rights.
	Take A Bite Out Of Crime campaign with McGruff the Crime Dog is initiated.
1981	First Victims' Rights Week occurs.
1982	President's Task Force on Victims of Crime makes recommendations to assist victims of crime and their relationship with the legal system.
	Federal Omnibus Victim and Witness Protection Act, which outlines victims' rights in the federal court system, is passed.
	Missing Children's Act, mandating that identifying information about missing children is entered into the FBI's computer system, is passed.
	James Q. Wilson and George Kelling introduce the idea of "broken windows," arguing that the physical and social appearance of an area contributes to crime.
	National Crime Prevention Council is founded.
	First British Crime Survey (BCS) is conducted.
1983	The Office for Victims of Crime (OVC) is created.
	First Victim Risk Supplement is conducted as part of the National Crime Survey.
	Ronald Clarke and British Home Office introduce <i>situational crime prevention</i> , which argues for attacking specific problems at specific times and places.
	Drug Abuse Resistance Education (D.A.R.E.), a school-based drug prevention program, is initiated.
	First electronic monitoring device is used to track an offender's location.
1984	The passage of the Victims of Crime Act (VOCA) establishes the Federal Crime Victims Fund.
	Report on the Minneapolis Domestic Violence experiment leads to mandatory arrests in many states.
	U.S. Attorney General's Task Force on Domestic Violence issues report.
1985	The United Nations General Assembly adopts the International Declaration on the Rights of Victims of Crime and the Abuse of Power.
1986	States receive VOCA funds for the first time.
	<i>The Reasoning Criminal</i> by Derek Cornish and Ronald Clarke, which introduces the idea of <i>rational choice theory</i> , is published.
1987	National Victims' Constitutional Amendment Network is created.
1988	The National Aging Resource Center on Elder Abuse (NARCEA) is established.
	State constitutional amendments addressing victims' rights are passed in Florida and Michigan.
	<i>Crime Prevention: Approaches, Practices and Evaluation</i> by Steven Lab, the first book devoted to the academic discussion of crime prevention, is published.
	Kirkholt Project successfully reduces crime in the U.K. by targeting repeat victimization.

1989	School Crime Supplement to the National Crime Survey is conducted.
	First European and North American Conference on Urban Safety and Crime Prevention is held.
	First International Crime Victimization Survey is conducted (subsequently conducted in 1992, 1996, 2000, 2004/2005, 2009).
1990s	Compulsory HIV/AIDS testing in sexual assault cases passes in most states.
1990	Student Right-to-Know and Campus Security Act, requiring colleges and universities to make crime statistics publicly available, is passed.
	Victims of Child Abuse Act, which introduces reforms to the federal system to make it less traumatic for child victims and witnesses, is passed.
	Victims' Rights and Restitution Act, creating a federal Bill of Rights for crime victims, is passed.
	Crime Control Act creates a federal Crime Victims' Bill of Rights.
	California is the first state to adopt legislation defining stalking as a criminal offense.
1991	Attorney General Guidelines for Victim and Witness Assistance establishes procedures for the federal criminal justice system to respond to the needs of crime victims.
	U.S. Supreme Court in <i>Payne v. Tennessee</i> allows victim impact statements in all cases.
	United Nations forms the Commission on Crime Prevention and Criminal Justice.
	Weed and Seed program, a community gang, drug, and crime prevention program, is initiated.
	Federal Bureau of Alcohol, Tobacco and Firearms institutes Gang Resistance Education and Training (G.R.E.A.T.) program in schools.
1992	Hate Crime Statistics Act is passed, requiring the collection of data on hate-based crimes.
	Situational crime prevention typology expands to 12 categories.
1993	Congress passes the Child Sexual Abuse Registry Act, which establishes a national database on child sex offenders.
	National Crime Victimization Survey (NCVS), the redesigned National Crime Survey, is fully implemented.
	Patricia Brantingham and Paul Brantingham introduce <i>crime pattern theory</i> , which argues that crime follows identifiable patterns that can lead to prevention actions.
	Chicago Alternative Police Strategy (CAPS), a program to implement community policing, begins.
	Crime Prevention Studies book series begins.
1994	Violence Against Women Act is passed, authorizing more than \$1 billion in funding to address domestic violence.
	Child Sexual Abuse Registry is implemented.
	International Centre for the Prevention of Crime (ICPC) is established.
	Comprehensive Communities Program, a crime prevention partnership, is initiated.

(Continued)

(Continued)

	Jacob Wetterling Crimes Against Children and Sexually Violent Offender Registration Act, requiring states to create a registry of child sex offenders, is passed.
1996	Community Notification Act, known as Megan's Law, is passed, requiring states to notify the community when a sex offender is released into the community.
	Second School Crime Supplement to the National Crime Victimization Survey is conducted.
	National College Women Sexual Victimization Survey is conducted.
	National Violence Against Women Survey (NVAWS) is conducted.
	Federal Anti-Stalker Act, which makes stalking a federal offense, is passed.
	Lautenberg Amendment to the Gun Control Act of 1968 bans abusers from possessing guns.
1997	Victims' Rights Clarification Act is passed, allowing victims to attend trials and provide victim impact statements.
	HEUNI and other agencies start developing the International Violence Against Women Survey (IVAWS), which is finalized in 2002.
1998	The Child Protection and Sexual Predator Punishment Act, enhancing punishments for sex crimes against children and protecting children from sexual predators via the Internet, is passed.
	Crime Victims with Disabilities Act is passed, improving prevention efforts and provided services to victims with disabilities.
	Identity Theft and Deterrence Act is passed, criminalizing identity theft and allowing individuals whose identity is stolen to be classified as victims.
	U.S. Department of Justice publishes <i>New Directions From the Field: Victims' Rights and Services for the 21st Century</i> , calling for improved treatment of crime victims.
	Strategic Approaches to Community Safety Initiative (SACSI) is started to combat violent crime.
	Crime and Disorder Act is passed, mandating new partnership initiatives aimed at reducing crime in the United Kingdom.
1999	<i>Crime Prevention and Community Safety: An International Journal</i> begins publication.
2000	Violence Against Women Act is reauthorized.
	Internet Fraud Complaint Center Web site (www.ifccfbi.gov) is created to assist in investigating and reducing Internet fraud.
	Trafficking Victims Protection Act, which provides assistance to victims of human trafficking and seeks to combat trafficking in people, is passed.
	Project Safe Neighborhoods, a program to reduce firearm-related violence, is initiated.
2001	Air Transportation Safety and System Stabilization Act includes victim compensation for victims of the September 11, 2001, attacks.
	International Centre for the Prevention of Crime (ICPC) hosts the First Annual Colloquium on Crime Prevention.
2002	All 50 states, the District of Columbia, U.S. Virgin Islands, Puerto Rico, and Guam have established crime victim compensation programs.

	United Nations publishes <i>Guidelines for Crime Prevention</i> .
	IVAWS first administered in Australia.
2003	PROTECT Act, also called the AMBER Alert law, is passed to increase the public's participation in resolving child abductions.
	Fair and Accurate Credit Transactions Act, which helps combat identity theft, is passed.
	Office on Violence Against Women is established in the Department of Justice.
	Situational crime prevention typology expands to current 25 categories.
	Prison Rape Elimination Act is passed, to assist provide resources for the prevention, treatment, victim services, and prosecution of in-prison rape.
	Keeping Children and Families Safe Act, which helps states combat child abuse and neglect, is passed.
2004	Justice for All Act, protecting the rights of crime victims, is passed.
	Laci & Conner's Law/Unborn Victims of Violence Act is passed, establishing that a fetus is a victim if harmed during the commission of a crime against a pregnant woman.
2005	National online sex offender registry is commissioned.
	IVAWS is carried out or under way in 11 countries.
	Violence Against Women and Department of Justice Reauthorization Act is passed.
2006	Adam Walsh Child Protection and Safety Act, which deals with supervision of sex offenders and procedures in child sex assault cases, is passed.
2008	Protect Our Children Act, which improves law enforcement's ability to prosecute child predators, is passed.
2009	Federal Trade Commission undertakes study of experiences of identify theft victims.
2010	<i>Encyclopedia of Victimology and Crime Prevention</i> is published.
